LIMITED WARRANTY

Subject to the terms and conditions below, Super Products warrants to its original purchaser ("original purchaser") that new equipment sold after the effective date of this limited warranty is free of defects in material or workmanship at the time it was shipped from Super Products for a period of 12 months from the shipment date, provided the equipment is used in a normal and reasonable manner and in accordance with all operating instructions. Super Products agrees, at its sole election, to either repair or replace (inclusive of labor) any parts and components manufactured by Super Products. Super Products must be notified with thirty (30) days of such defect or failure, at which time Super Products will provide instructions on the warranty procedures to be followed. This limited warranty is subject to those limitations and exclusions as described in such warranty procedures. Super Products will not honor claims for warranty that have not been previously authorized via the warranty procedures (including that labor rates and times must be preapproved in writing).

In addition, Super Products agrees to provide extended warranties for certain components as indicated below: (extended warranty periods begin from the shipment date to the original purchaser).

- "10 Years on the debris body and all poly water tanks (from defects in material or workmanship).
- "3 Years on Super Products' single-piston water pump (from defects in material or workmanship).

Super Products does not provide any express or implied warranty to (and Super Products shall not be responsible for)

- "Any major components of the equipment that Super Products used in manufacturing or assembling the equipment but that Super Products did not manufacture (including, but not limited to, truck engines or any component of the chassis, vacuum pump, water pump, and hydraulics, driveline, power takeoff, and transfer case). Super Products assigns to the original purchaser any warranty extended by the manufacturer of such components. Disposition of any warranty claim for such components will be at the sole discretion and remedy of the component supplier. Super Products shall have the right of disposal of parts and components that are replaced.
- "Normal wear parts, including but not limited to, valves, gaskets, light bulbs, filters, oils and fluids.
- "Consumable items, including but not limited to, vacuum hose, sewer hose, nozzles, and vacuum tubes.
- "Normal adjustments and maintenance services.

This limited warranty does not cover any damage to nonfunctioning or malfunctioning of the equipment, or any components or parts comprising the equipment, due to: (a) any alteration, substitution, misuse or abuse by the original purchaser or its agents; (b) their non-compliance with any operator's manual, maintenance manual or warning published by Super Products or the component manufacturer and issued to the original purchaser; or (c) their non-compliance with the general standard of reasonable care.

OTHER THAN AS EXPRESSLY STATED HEREIN, THERE ARE NO OTHER WARRANTIES OF ANY KIND, EXPRESS OR IMPLIED. MORE SPECIFICALLY, THERE ARE NO IMPLIED WARRANTIES OF FITNESS FOR A PARTICULAR PURPOSE OR OF MERCHANTABILITY. ORIGINAL PURCHASER ACKNOWLEDGES AND AGREES THAT SUPER PRODUCTS MAKES NO REPRESENTATIONS OR PROMISES, AND THAT ORIGINAL PURCHASER IS NOT RELYING UPON ANY ORAL OR WRITTEN REPRESENTATIONS OR PROMISES, REGARDING ANY PERFORMANCE CHARACTERISTICS OR CAPABILITIES OF THE EQUIPMENT OR THE COMPONENTS THEREOF (INCLUDING, WITHOUT LIMITATION, THE INTEGRATION OF SUCH COMPONENTS OR THE COMBINATION IN WHICH SUCH COMPONENTS MAY BE USED), EXCEPT AS EXPRESSLY STATED IN THE DESCRIPTION OF THE EQUIPMENT CONTAINED IN THE ACKNOWLEDGMENT OR OTHER WRITTEN DESCRIPTIONS PROVIDED BY SUPER PRODUCTS.

SUPER PRODUCTS' MAXIMUM LIABILITY SHALL NOT EXCEED AND ORIGINAL PURCHASER'S REMEDY IS LIMITED TO EITHER (a) REPAIR OR REPLACEMENT OF THE DEFECTIVE EQUIPMENT, OR AT SELLER'S OPTION (b) RETURN OF THE PRODUCT AND REFUND OF THE PURCHASE PRICE. SUCH REMEDY SHALL BE ORIGINAL PURCHASER'S ENTIRE AND EXCLUSIVE REMEDY. ORIGINAL PURCHASER ACKNOWLEDGES THAT UNDER NO CIRCUMSTANCES SHALL SUPER PRODUCTS BE LIABLE FOR ANY SPECIAL, INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES OF ANY KIND ARISING IN CONNECTION WITH OR OUT OF THE EQUIPMENT AND THAT SUPER PRODUCTS' LIABILITY, WHETHER IN CONTRACT, TORT, UNDER ANY WARRANTY OR OTHERWISE SHALL NOT EXCEED THE RETURN OF THE AMOUNT OF THE PURCHASE PRICE PAID BY BUYER, WHICH AMOUNT MAY BE REDUCED DUE TO DEPRECIATION AND DAMAGE BEYOND NORMAL WEAR AND TEAR. ORIGINAL PURCHASER UNDERSTANDS THAT THE LIMITATION OF SUPER PRODUCTS' LIABILITY RELATING TO THE EQUIPMENT IS A MATERIAL TERM OF THE PARTIES' TRANSACTION.

This limited warranty is not transferable without the prior written approval of Super Products.

NO ACTION ARISING OUT OF ANY CLAIMED BREACH OF THIS LIMITED WARRANTY OR TRANSACTIONS UNDER THIS LIMITED WARRANTY MAY BE BROUGHT MORE THAN TWO (2) YEARS AFTER THE CAUSE OF ACTION HAS OCCURRED.

130 W Boxhorn Drive, Mukwonago, WI 53149 • P: 800.837.9711 • www.superproductsllc.com

Safety

General Safety Instructions and Practices

A careful operator is the best operator. Safety is of primary importance to the manufacturer and should be to the owner/operator. Most accidents can be avoided by being aware of your equipment, your surroundings, and observing certain precautions. The first section of this manual includes a list of Safety Messages that, if followed, will help protect the operator and bystanders from injury or death. Read and understand these safety messages before assembling, operating, or servicing this equipment. This equipment should only be operated by those persons who have read the manual, who are responsible and trained, and who know how to do so responsibly.

The Safety Alert Symbol combined with a Signal Word, as seen below, is used throughout this manual and on decals which are attached to the equipment. The Safety Alert Symbol means: “ATTENTION! BECOME ALERT! YOUR SAFETY IS INVOLVED!” The Symbol and Signal Word are intended to warn the owner/operator of impending hazards and the degree of possible injury faced when operating this equipment.

Practice all usual and customary safe working precautions and above all remember safety is up to you. Only you can prevent serious injury or death from unsafe practices.

**WARNING**

Indicates a potentially hazardous situation which, if not avoided, **COULD** result in death or serious injury.

**CAUTION**

Indicates a potentially hazardous situation which, if not avoided, **MAY** result in minor or moderate injury and property damage. It may also be used to alert against unsafe practices.

**NOTICE**

Indicates a potentially hazardous situation which, if not avoided, **MAY** result in property damage. It may also be used to alert against unsafe practices.

**NOTE**

Identifies points of particular interest for more efficient and convenient operation or repair.

**DANGER**

Indicates an imminently hazardous situation which, if not avoided, **WILL** result in death or serious injury.

READ, UNDERSTAND, and FOLLOW the following Safety Messages. Serious injury or death may occur unless care is taken to follow the warnings and instructions stated in this manual and in the Safety Messages on the implement. Always follow the instruction in this manual and use common sense to avoid hazards.
Visual Attention Safety

Pictographs are used throughout this manual to help bring your visual attention to safety issues.

<table>
<thead>
<tr>
<th>SAFETY HAZARD</th>
<th>SAFETY AVOIDANCE</th>
<th>SAFETY PREVENTION</th>
</tr>
</thead>
</table>
| Pictograph surrounded by a triangle indicates a Safety Hazard that must be avoided.  
Example:  
![Equipment contacting overhead electrical lines](image) | Pictograph by itself or inside a box indicates an avoidance procedure that should be followed to prevent injuries.  
Example:  
![Always shut off engine and remove key before working on equipment](image) | A circle with a slash through it indicates an action that is prohibited.  
Example:  
![No Smoking](image) |

Figure 1-1

(800) 837-9711
## Personal Protection Equipment (PPE)

Always wear protective clothing and personal safety devices issued to you or required by job conditions. This should always include:

- Hard hat
- Safety shoes
- Safety glasses, goggles, or face shield
- Heavy gloves (chemical resistant)
- Hearing protection
- Reflective clothing

![Diagram of PPE](image)

**WARNING**

Never wear loose clothing or jewelry that can catch on controls or other parts of the machine. Loose clothing can be drawn into the suction hose. Never wear a wristwatch or finger rings when working on or around equipment.
When Using Pressurized Air or Water

When using pressurized air or water for cleaning or material erosion/movement, you should use the following:

- Face Shield
- Wet Weather Protective Suit
- Waterproof Gloves
- Respirator
- Safety Boots with Metatarsal Guard

Figure 1-3
General Hazards and Prevention Safety

<table>
<thead>
<tr>
<th>Read and Understand Operator’s Manual</th>
<th>DO NOT USE DRUGS or ALCOHOL before or while operating equipment</th>
<th>Always shut off engine and remove key before working on equipment</th>
<th>Always install Debris Body and tail gate props before working under equipment</th>
<th>Always wear your seatbelt</th>
</tr>
</thead>
</table>

**WARNING**

To avoid serious injury or death, do the following:

- **Read, understand, and follow** the operator’s manual instructions, warnings, and safety messages.
- **Do not allow** untrained or unauthorized persons to operate equipment.
- **Do not allow** untrained coworkers to operate or assist in operating equipment.
- **Do not allow** bystanders near equipment or work area.
- **Do not allow** anyone to operate equipment while under the influence of drugs or alcohol.
- **Do not use drugs or alcohol** before or while operating equipment.
- **Consult** medical professional for medication impairment side effects.
- **Wear** appropriate safety personal protective equipment (PPE).
- **Wear** appropriate breathing respirator and protective suit when operating with hazardous or unknown substances.
- **Do not wear** loose clothing or jewelry to avoid injury from entanglement in rotating parts.
- **Keep body and limbs away** from suction inlets.
- **Do not open or close** the tailgate or raise or lower the body unless the area is clear of people and obstructions.
- **Never** put any part of your body under an open tailgate unless it is sufficiently propped.

- **Never operate** the vacuum pump unless you are certain the suction hose is clear of people and obstructions.
- **Never operate** the vacuum pump without the safety relief systems working properly as described within this manual.
- **Do not enter the debris body** if hazardous materials are suspected inside the debris body. Take the unit to a certified tank cleaning facility.
- **Always shut off the engine**, remove the key, and set the parking brake before working on the truck or equipment.
- **Stay alert**. Prolonged operation can cause fatigue. **Stop and rest**.
General Hazards and Prevention Safety — continued

Visibility Conditions When Operating
- Operate in daylight or with lights that gives at least 50 yards clear visibility.
- Be able to see and identify passersby, steep slopes, ditches, drop-offs, overhead obstructions, power lines, debris, and foreign objects.
- Use extreme care when backing up. Vision may be limited. Severe damage or injury can occur.
- Do not run engines in enclosed building without adequate exhaust ventilation.

Equipment Guards
- Never operate machine if equipment guards are damaged or missing.
- Replace missing or damaged guards immediately!

Mounting and Dismounting Truck or Equipment
- Only mount or dismount when truck and moving parts are stopped.
- Always use three-point contact when climbing on or dismounting equipment.
- Walkways, steps, and handrails should be checked before use to ensure a proper non-slip surface. Replace or repair damaged component immediately.

Hot Surface
- Stay clear of hot surfaces such as mufflers, hydraulic pumps, valves, and tanks.
- Relieve pressure from tank, reservoirs, valves, and hoses before servicing or opening.

Safety Signs
- Replace missing, damaged, or unreadable safety signs immediately!

Figure 1-5

<table>
<thead>
<tr>
<th>Use adequate lighting for proper vision</th>
<th>Do not touch hot surface. Keep hands and limbs away from hot surfaces</th>
<th>Tanks can be under pressure. Relieve pressure before opening</th>
<th>Use three-point contact when climbing on equipment</th>
</tr>
</thead>
</table>

- Use adequate lighting for proper vision.
- Do not touch hot surface. Keep hands and limbs away from hot surfaces.
- Tanks can be under pressure. Relieve pressure before opening.
- Use three-point contact when climbing on equipment.
Crushing Hazards and Prevention Safety

### Debris Body Prop Support

<table>
<thead>
<tr>
<th>![Warning Icon]</th>
<th>![Warning Icon]</th>
<th>![Warning Icon]</th>
<th>![Warning Icon]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Never go under raised Debris Body until prop is installed</td>
<td>Never go under raised tailgate until prop is installed</td>
<td>Truck can tip over while dumping debris on un-level surface</td>
<td>Slow down on curves, High Center of Gravity</td>
</tr>
</tbody>
</table>

#### WARNING

Never go under raised debris body until prop is installed. Failure to do so could result in personal injury or death.

1. Raise body sufficiently to allow body prop support to be swung into position.
2. Swing body prop support into support position.
3. Slowly lower body until body contacts body prop support.
   - To remove body prop support, reverse above procedure.

### Tailgate Prop Support

<table>
<thead>
<tr>
<th>![Warning Icon]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always position tailgate prop in proper position before entering any areas beneath tailgate or entering body. Failure to do so could result in serious injury or death.</td>
</tr>
</tbody>
</table>

#### WARNING

Always position tailgate prop in proper position before entering any areas beneath tailgate or entering body. Failure to do so could result in serious injury or death.

1. Raise tailgate sufficiently to allow tailgate prop support to be swung into position.
2. Swing body prop support into support position.
3. Slowly lower body tailgate until tailgate contacts tailgate prop support.

### Truck Tip Over

<table>
<thead>
<tr>
<th>![Warning Icon]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always wear seat belt while seated in truck to prevent injury.</td>
</tr>
</tbody>
</table>

#### WARNING

Always wear seat belt while seated in truck to prevent injury.

- Truck driver must have valid and appropriate training license before transporting liquids on public roads.
- Slow down on curves to prevent truck from tipping over.
- Always ensure unit is on firm and level ground before operating the dump system. When dumping, raise the body in steps, allowing the material to dump out in a steady flow.
- **Do not allow** people and/or vehicles beside debris body while dumping.
- Never drive truck with raised debris body.
- Keep truck away from drop-offs and soft soil shoulder where truck could tip over.
Trip and Fall Prevention Safety

- **Always maintain** three-point contact with the machine, using two hands and one foot, or two feet and one hand, at all times during entry and exit. Never grab control levers or steering wheel when mounting or dismounting machine.

- **Walkways and steps** should be checked monthly to ensure a proper non-slip surface. Repair or replace damaged walkway or steps.

- **Keep** grab handles, steps, and walkways free of mud, oil, grease, and other foreign material. Clean non-skid surface material as required.

- **Ground level personnel** must be present whenever climbing onto unit to protect against inadvertent operation.

- **During operation**, occupants on elevated equipment surfaces must wear a full body harness with a lanyard attached to an authorized lanyard anchorage point. Attach only one lanyard per lanyard anchorage point.

- **Face the machine** when entering or leaving the elevated equipment surfaces.

- Only mount or dismount when truck and moving parts have completely stopped.
High-Pressure Fluid Leak Hazards

**DANGER**

To avoid serious injury or death from high-pressure hydraulic oil leaks penetrating skin, follow these rules:

- **Do not operate** equipment with oil or fuel leaks.
- **Keep** all hydraulic hoses, lines, and connections **tight** and in **good condition** before applying pressure to the system.
- **Relieve hydraulic pressure** before servicing the hydraulic system.
- **Remove** and replace or test hydraulic hoses if a leak is suspected. Have a qualified service facility perform the test.

**DANGER**

High-pressure fluid leaks can be invisible. When checking for hydraulic leaks and working around hydraulic systems, follow these rules:

- **Always wear** safety glasses and impenetrable gloves.
- **Use** paper or cardboard to search for leaks.
- **Do not use** hands or body parts to search for leak.
- **Keep** hands and body **away** from pin holes and nozzles ejecting hydraulic fluid.

**CAUTION**

Use caution when removing hydraulic tank cap. Contents may be under pressure.

- Tank contents may be under pressure.
- **Allow oil to cool** before removing cap slowly.
- **Relieve** oil pressure before removing cap slowly.
- **Stay away** from hot oil that may spray from tank or hoses.

**DANGER**

High-pressure hydraulic oil can puncture skin. If injured, seek immediate medical attention and inform the physician of the cause of the injury. Surgery is required to remove the fluid from the body. Failure to seek proper medical attention will result in serious injury or death.
Power Lines/Static Electrical Hazard Warnings

**DANGER**

*This machine is not insulated and does not provide protection from contact or being near electrical current.*

- **Never** operate the unit in an area where overhead power lines, overhead or underground cables, or other power sources may exist without ensuring that the appropriate power or utility company has de-energized the lines.
- **Always** check for power lines before raising boom or debris body.

Follow all requirements for using mobile equipment when working around power lines. The Occupational Safety and Health Administration (OSHA) requirements apply to most workers. The following information is from OSHA. Additional information can be obtained from www.osha.gov.

**Overhead Power Line Tips for Construction Workers Before You Begin Construction Work**

- Survey the site for overhead power lines.

**NOTE**

*Never get within 10 feet of an overhead power line!*

- Consider all overhead lines as energized until the electric utility indicates otherwise or an electrician verifies that the line is not energized and has been grounded.
- In construction work, an overhead power line safety component should be part of your employer's overall safety and health program and safety training.

**WARNING**

*Electrically insulating coating must be used on water nozzles to prevent electrical contact with underground electrical power lines.*

- If overhead lines are present, call the utility company and ask if the utility company can shut off the lines while you are working near them.
- If overhead lines cannot be shut down, ask the utility company if they can install insulation over the lines during the time you will be working near them.

**Working with Tools and Equipment**

- If the lines cannot be shut down and/or insulation cannot be applied, a minimum safe distance of 10 feet must be established.
- Only use non-conductive ladders when working on or near overhead power lines.
- Employees shall not be permitted to approach or carry any conductive object closer than 10 feet to an energized line.
SAFETY

Chemical and Biological Hazard Safety

![Chemical Burning Skin Hazard](image1.png) ![Chemical, Dust and Fumes Inhalation Hazard](image2.png) ![Wear Respirator when around hazardous fumes](image3.png)

**Figure 1-11**

**Chemicals and Diesel Engine Exhaust**

**WARNING**

Operating, servicing and maintaining this equipment can expose you to chemicals including gasoline, diesel fuel, lubricants, petroleum products, engine exhaust, carbon monoxide, and phthalates, which are known to the State of California to cause cancer and birth defects or other reproductive harm. To minimize exposure, avoid breathing exhaust, do not idle the engine except as necessary, service your vehicle in a well-ventilated area and wear gloves or wash your hands frequently when servicing your vehicle. Battery posts, terminals and related accessories contain lead and lead compounds, chemicals known to the state of California to cause cancer, birth defects or other reproductive harm. For more information go to www.P65Warnings.ca.gov. This website, operated by California’s Office of Environmental Health Hazard Assessment, provides information about these chemicals and how individuals may be exposed to them.

**WARNING**

Always read carefully and comply fully with the manufacturer’s instructions when handling fuels, oils, solvents, cleaners, and any other chemical agent.

**Sewer Gas Hazard**

- Do not smoke or have lighted materials in or around sewer lines, drains, or catch basins.

**Chemical Waste Hazard**

- Storm drains, catch basins, and sewers may contain harmful chemicals. To prevent contamination and injury, wear chemical resistant gloves, long sleeves, trousers, and safety glasses or face shields.
- Seek immediate medical attention if exposure or contamination is suspected.

**Biological Hazards**

- Germs and other biological hazards are common in sewers, drains, and catch basins. Use appropriate personal protective equipment to avoid injury and contamination. Get medical attention for injuries associated with cleaning sewers, drains, and catch basins if biological contamination is suspected.

**Dust Hazard**

- Repeated or substantial breathing of hazardous dusts, including crystalline silica, could cause fatal or serious respiratory disease including silicosis. Concrete, masonry, many types of rock, and various other materials contain silica sand. California lists repairable crystalline silica as a substance known to cause cancer. Operation of this equipment under certain conditions may generate airborne dust particles that could contain crystalline silica. In those conditions personal protective equipment including an appropriate respirator must be used. If excessive dust is generated, a dust collection or suppression system should also be used during operation.
Transport Safety and Hazards Warnings

![Diagram showing transport hazards: Overhead Clearance Hazard, Equipment contacting overhead electrical lines, Look out and Avoid other personnel.]

**WARNING**

Follow all steps before moving truck when towing or transporting equipment to avoid serious injury and death:

**Before Transporting Truck Inspection**
- Ensure unit is road worthy by performing a pre-trip inspection before driving to and from job site.
- Check that tailgate is closed and properly locked.
- Ensure all equipment is properly secured and positioned for maximum visibility and adequate clearances.
  - Close all water drain valves and install all plugs and strainers previously removed.
  - Check that boom (if equipped) is locked in transport position and properly secured.
  - Check that all tools, accessories, and work tubes/hoses are properly secured.
  - Check that cabinet doors and access panels are closed.
  - Check that all clean-out doors are closed and latched shut.
  - Check that the dust chute and tailgate are closed and latched shut.
- Always measure overhead clearance height of truck and equipment.
- Check for low hanging electric or telephone wires and power cables on the ground.
- Look out for and avoid other personnel, machinery and vehicles in the area. Use a spotter if you do not have clear view.

**Never Exceed your Gross Vehicle Weight Rating (GVWR)**
- In operation on public highways, the combined weight of the chassis, body, and payload must not exceed the gross vehicle weight rating of the chassis as rated by the cab and chassis manufacturer.

**NOTE**
- It is possible to overload the unit capacity.
- Load your water supply at or near the job site.
- Regulate your work to maintain minimum water storage when leaving the work location.

**Pedestrian Safety**
- Conduct a visual check and warning (honk horn) before starting or moving the truck to ensure the safety of people on the ground and other equipment in the area.
- Be aware of all personnel who are working on the ground.
- Look out for and avoid other personnel, machinery and vehicles in the area. Use a spotter if you do not have clear view.
Transport Safety and Hazards Warnings — continued

Determine Stopping Characteristics of Truck for Transporting Braking Tests
- Stopping distance with loaded debris body will be greater than empty truck.
- Reduce travel speed on wet or icy roads; stopping distances increase.

Determine Maximum Turning Speed Before Operating on Roads or Uneven Ground
- Test equipment by slowly increasing speed on turns to determine if it can be operated at higher speeds.
- Use reduced turning speeds on sharp turns to avoid equipment turning over.
- Truck has a high center of gravity when carrying a loaded debris body. Use extreme caution when transporting at highway speeds. Slow down for sharp corners to avoid tipping or turning over.

When Transporting Equipment
- Do not move truck unless debris body is fully lowered in the horizontal storage position.
- Always wear seat belt when operating truck.
- Follow all local traffic regulations.
- Use low speeds to avoid overturn tipping when debris body is filled.

- Use low speeds and gradual steering on curves, hills, rough or uneven surfaces, and wet roads.
- Turn on truck flashing warning lights when driving slower than traffic.
- Transport the truck only at safe speeds that allow for proper control of the truck while driving and stopping.
SAFETY

Job Site Safety and Hazard Warnings

To Help Avoid Injury

If job site classification is in question or if the possibility of unmarked electric utilities exists, classify the job site as electric.

Prepare for Working Near Existing Utilities

- Boots must have high tops and meet the electric hazard protection requirements of ASTM F2413 or ASTM F117, when tested at 14,000 volts. Tuck legs of pants completely inside boots.
- Gloves must have 17,000 AC maximum use voltage, according to ASTM specification D120. If working around higher voltage, use gloves and boots with appropriately higher ratings.

Plan for Emergency Services

- Make sure you have the telephone numbers for local emergency and medical facilities on hand, and access to a telephone.

Arrange for Traffic Control

- If working near a road or other traffic area, contact local authorities about safety procedures and regulations.
- Always activate beacons and flashers before job setup.
- Always use safety cones.
- If working on a roadway, follow required temporary traffic control measures.
- Use job site controls, such as cones and barricade tape, to prevent bystanders from entering potentially hazardous areas and to keep them away from machinery.
Job Site Safety and Hazard Warnings — continued

**Inspect the Job Site**
- Follow U.S. Department of Labor regulations on excavating and trenching (Part 1926, Subpart P) and other similar regulations.
- Contact your local One-Call (811 in USA) or the One-Call referral number (888-258-0808 in USA and Canada) to have underground utilities located before digging. Also contact any utilities that do not participate in the One-Call service.
- Inspect job site and perimeter for evidence of underground hazards, such as the following:
  - “Buried utility” notices
  - Utility facilities without overhead lines
  - Gas or water meters
  - Junction boxes
  - Drop boxes
  - Light poles
  - Manhole covers
  - Sunken ground
  - Mark location of all buried utilities and obstructions
- Walk and inspect job site for unsafe conditions and identify any potential hazards for operators and bystanders. Do not operate equipment if unsafe conditions cannot be controlled.

**Visibility Conditions When Operating**
- **Operate in daylight** or with lights that provide adequate visibility to perform job safely.
- **Make sure** passersby, steep slopes, ditches, drop-offs, overhead obstructions, and power lines are visible and identifiable.

**Prepare the Job Site**
- Open manholes and other access openings create risk of trips and falls. Be aware of such locations and do not step in or over them. Ensure manhole covers and other covers are in place prior to leaving the job site.
- Be aware of traffic and pedestrians on the job site. Use extreme caution while moving around the vehicle to avoid contact with other moving vehicles. Before stowing the boom or moving the vehicle, make sure pedestrians are clear of the area.
- Clear the area to be excavated. Remove rocks or branches too large for vacuum hose.
- Select a solid area to stand on while excavating.

**Fire Extinguisher**
If required, mount a fire extinguisher near the power unit but away from possible points of ignition. The fire extinguisher should always be classified for both oil and electric fires. It should meet legal and regulatory requirements.
Vacuum Equipment Operation Safety and Hazard Warnings

It is the operator's responsibility to be knowledgeable of all potential operating hazards and to take every reasonable precaution to ensure that oneself, others, animals, and property are not injured or damaged by the operation of this equipment. Do not operate the equipment if passersby or untrained persons are within the active job site.

Never operate this equipment if a shield or guard is missing or in poor operational condition.

NOTE
Read and understand all operating instructions and the entire safety section of this manual and the truck manual before attempting to operate any equipment.

If you do not understand any of the instructions, contact your nearest authorized dealer for a full explanation. Pay close attention to all safety signs and safety messages contained in this manual and those affixed to the unit.

WARNING
Always set the truck parking brakes and chock the wheels. Unexpected truck movement can cause serious injuries.

Before operating the equipment, conduct a walk-around inspection of the equipment for proper operation. Repair any improperly functioning, broken, or damaged equipment before operating.
Inspect the job site for unsafe conditions and identify any potential hazards for operators and bystanders. Do not operate equipment if unsafe conditions cannot be controlled.

Emergency Stop Button Function
This equipment is equipped with multiple emergency stop buttons that can be activated at any time during operation to disconnect the power and shut down the vacuum, boom, and body operation. Emergency stop buttons are located on the drivers side, passenger side, and each remote pendant.
Pressing the emergency stop button while the machine is in operation has the following results:
- Brings truck RPM to idle
- Opens the vacuum relief valve
- Shuts off the water pump
- All functions remain inactive
Vacuum Equipment Operation Safety and Hazard Warnings — continued

To Restore Power
1. The operator must reset the E-Stop button.
   • Twist the emergency stop button, and it will pop out
2. Upon resetting the emergency stop switch, the truck does not automatically go back to the state it was in when the button was pushed.
3. The switch panel must have power restored to continue operation. This will activate the boom and body functions at a neutral state.
   • The engine RPM must be increased
   • Water pump is engaged
   • Vacuum relief is closed

Vacuum Operation Safety

**WARNING**

When operating the vacuum equipment with extended vacuum hoses or tubes lying horizontal on the ground, you must install a vacuum relief T-type valve in the hose line.

NEVER operate the vacuum system without the vacuum relief valve being installed. Failure to install and operate the vacuum relief valve properly may result in serious injury and/or death.

The in-line vacuum relief valve must be in line within 50 feet from the end of the hose or pipe for proper operation.

**WARNING**

Make sure no one is near the end of the vacuum hose and that the vacuum relief door is open before engaging the vacuum pump. Failure to do so could cause personal injury.

• Keep vacuum tools and hoses away from face and body. An injury caused by vacuum can be serious. The vacuum must be stopped or the vacuum pressure relieved as quickly as possible at any sign of danger. Seek medical attention immediately.
• Do not attach hose, pipe, or accessories with the vacuum on. The vacuum can trap fingers, hands, and feet with enough force to crush or cut.
• Do not use a bare open hose end for vacuuming. A variety of hose and attachments are available to keep the operator clear of the hose opening.
Vacuum Equipment Operation Safety and Hazard Warnings — continued

**CAUTION**

Failure to engage parking brakes and/or position wheel chocks could result in unexpected chassis movement, which could cause bodily injury or property damage.

**DANGER**

Never operate engines where there are or can be combustible vapors. Vapors pulled into an engine air intake can cause engine acceleration and over speeding. This can result in death, injury, and property damage.

Pre-Start Checklist

- Ensure operator and co-workers have read and understood the safety instructions in the Operator’s Manual.
- Ensure that all required maintenance has been performed.
- Park truck on level ground and set parking brakes.
- Ensure cleanout doors and tailgate are closed and latched shut.
- Attach suction hose and tubing as required, including relief valve.
- The unit must be thoroughly cleaned between jobs to prevent cross-contamination or chemical reactions.
- Cleaning chemicals must be compatible with the residual debris material to prevent hazardous reactions.
- Cleaning chemicals must be compatible with equipment seals to prevent equipment damage.

Vacuum Operation

**NOTE**

See “Vacuum Relief Valve Safety” on pages 1-19–1-22.

- Never use the vacuum in any type of rescue operation.
- Operating the unit inside a building or confined areas can create additional risks to the unit, operators, and building occupants. Engine exhaust gas can reach deadly levels. Heat buildup from the engine and blower discharge can overheat equipment.
- Never use an air mover machine for vacuuming hydrocarbon or flammable materials unless the flash point of the material is 150°F or higher. Pressurized or pump off loading is not permitted unless the flash point of the material is 150°F or higher, unless nitrogen is present.

![Figure 1-18](image-url)
Vacuum Relief Valve Safety

Vacuum Relief Valves
The in-line T-type vacuum relief valve is delivered with the unit, and its operation is described in this procedure. The unit will also have a remote-operated vacuum relief valve. It consists of a hinged door that is opened and closed by a pneumatic cylinder. The vacuum relief valve is controlled by the operator at the front control panel or by the wired and wireless pendant remote. Its operation is also described in this section.

- Always use emergency T-type relief valve, except as noted below.
- When safety person is used, make sure he/she is in full view of person(s) at the end of vacuum hose.
- When working close to end of hose, wear tight-fitting clothes. Keep shirts and jackets closed so that shirt tails and jacket tails will not be pulled into end of hose. Remove loose-fitting jewelry such as bracelets and necklaces unless they are under tight-fitting clothing.
- Do not use hand or foot to remove obstructions from end of hose.
- Keep all body extremities and clothing from end of hose.
- The only time the emergency T-type relief valve is not required is when the operator is working vertically off the boom hose. In this case only, the operator should use the remote-operated relief valve. Failure to comply with this requirement could cause bodily injury, for which the manufacturer will not be responsible.

Operating the T-Type Vacuum Relief Valve

![WARNING]
Test the type T-type vacuum relief valve before using to ensure proper relief operation and to prevent injury or death.

1. With vacuum pump shut down, assemble T-type vacuum relief valve into vacuum inlet tubing or hose. The T-type vacuum relief valve should be kept as close as possible to the person working at the end of the vacuum hose (maximum of thirty feet away). If there is more than one operator, there must be a separate T-type valve for each operator.
2. Place a safety belt around the waist of the person working at the end of the vacuum inlet hose.
3. Attach the end of the pull cord to the loop on the safety belt. It is important to keep the pull cord as short as possible. Depending on how far the person with the safety belt is from the T-type vacuum relief valve, it might be necessary to shorten the pull cord. To shorten the pull cord (always keep pull cord swivel snap attached to loop on safety belt), loop the pull cord through the loop on the safety belt at the length required and knot the loop. During operation, the pull cord should be checked frequently (minimum of every two hours) to see that it can be operated freely and has not been damaged.

![WARNING]
If the person operating at the end of the vacuum hose is in a confined space or cannot easily reach the pull cord on their safety belt, there must be a safety person(s) wearing a safety belt with a pull cord attached who is in a position to view the person(s) working at the end of the vacuum hose.

4. When needed, the vacuum relief valve can be opened by pulling on the pull cord, which will greatly reduce the amount of vacuum at the end of the inlet hose. To totally eliminate the vacuum at the end of the inlet hose, the vacuum pump should be shut down.
5. With the vacuum pump shut down and the truck's engine off, reset the vacuum relief valve by placing the circular disk on top of the T-section.
6. When the relief valve is not being used, store it properly to prevent damage.
Vacuum Relief Valve Safety — continued

Testing the T-Type Vacuum Relief Valve

NOTE

The following test should be done every time the vacuum relief valve is assembled into the vacuum inlet line or every two hours of during operation, whichever is more frequent.

1. Visually inspect the vacuum relief valve, pull cord, and safety belt. Repair or replace as needed.
2. With the vacuum pump shut down and the truck’s engine turned off, assemble the vacuum relief valve in the vacuum inlet line as shown in Figure 1-20. Attach the pull cord to the vacuum relief valve.
3. Insert the male plug into the end of the vacuum relief valve or vacuum inlet hose, whichever is at the inlet point.
4. With the vacuum relief valve closed, start up the vacuum pump and pull full vacuum.
5. At full vacuum, pull the cord to open the vacuum relief valve.
6. After the test, shut down the vacuum pump per operating procedure.
7. Open the vent door to make sure all vacuum is relieved before removing the plug from the end of the vacuum inlet hose.
8. Reset the vacuum relief valve. Remove and store the vacuum relief valve if it is not going to be used.

WARNING

If the vacuum relief valve is not working properly, personnel should not be allowed to work at the end of the vacuum inlet hose due to possible injury or death.

Figure 1-19

Figure 1-20
Vacuum Relief Valve Safety — continued

Operating the Remote-Operated Vacuum Relief Valve

The remote-operated vacuum relief valve is controlled by the pendant remote control or the optional wireless remote control. The operation and testing instructions of this section apply to all relief valve controls.

- A safety person who is in full sight of the operator(s) must be used. The safety person must hold the remote control for the relief valve. Never allow workers at the end of the hose to operate the system without the safety person in position.
- Before cleaning the suction tubes or hoses, lower the engine speed to idle, open the relief valve, turn off the truck’s engine, remove the keys, and lock the cab doors.
- When working close to the end of the hose, wear tight-fitting clothes. Keep shirts and jackets closed so that they will not be pulled into the end of hose.
- Remove loose-fitting jewelry such as bracelets and necklaces unless they are under tight-fitting clothing.
- Do not use hands or feet to remove obstructions from the end of the hose.
- Keep all body extremities and clothing away from the end of the hose.

NOTE
See safety instructions for the vacuum relief valve safety.

WARNING
• For pendant remote control:
  - Insert the pendant cord into the socket located at the front control panel on the passenger side.
  - Route pendant cord to work area. Care should be taken in running pendant cord to work area from truck so that the cord will not be run over or damaged.
• The remote-operated relief valve must only be used with a safety person. The safety person must be holding the remote and must be in a position to observe the person(s) operating the vacuum hose. Never attach the remote to the work hose or to the person actually vacuuming up the product since situations could develop wherein the person using the vacuum hose may not be able to reach the remote.
**SAFETY**

- If the safety person observes an unsafe or dangerous action of any type, he/she should immediately press the OPEN vent door button on the remote pendant. Only after all potential dangers have been removed should the vent door be closed and normal vacuum operations continue. The safety person should continue to be in a position to observe all vacuum hose operators until those operators have moved a safe distance from the end of all vacuum work hoses.
- After vacuum operation is completed and the vacuum pump is shut down, properly store pendant to prevent damage when truck is being moved.

**WARNING**

Never move close to the end of any vacuum hose unless the safety person has the remote pendant and is in a position to observe all operators. Failure to comply with this could result in serious personal injury or death.
Testing the Remote-Operated Vacuum Relief Valve

NOTE

The following test should be done every time the pendant is plugged in or every two hours of operation, whichever is more frequent.

1. Visually inspect the pendant cord, electrical plug, and control switch for damage. Repair or replace as needed.

2. If the pendant is not currently plugged in, insert the electrical plug on the end of pendant cord into the socket located at the control panel on the passenger side.

3. With vacuum pump shut down and truck engine off (see operating procedure “start up and shut down of vacuum pump” in manual) insert male plug into end of inlet vacuum hose.

4. Start up the vacuum pump per operating procedure in manual.

5. With unit at full vacuum, press the VENT OPEN button on the remote and verify that the vacuum relief door has opened. Press the VENT CLOSE button and verify that the vacuum relief door has closed. Observe that the vacuum door has opened by inspecting the Relief Valve Door to ensure it is in the open position.

WARNING

If vacuum relief valve is not working properly, personnel should not be allowed to work at end of vacuum hose due to possible personal injury or death. Repair or replace valve before operating vacuum pump.

6. After testing, shut down the vacuum pump per operating procedure.

CAUTION

Never work beyond the distance from the truck that the wireless remote control was previously tested at. Failure to comply could result in equipment not properly operating.
High-Pressure Water Safety and Hazard Warnings

**Figure 1-23**

- Release pressure before attempting to open any door, hatch, hose, or tube.
- Do not bend or strike high-pressure lines.
- Report any loose or damaged tubes or hoses to mechanics so repairs can be made prior to continued use.

**WARNING**

In the event of any water jet injury:
- Seek medical attention immediately!
- Inform the physician of the cause of the injury.
- Tell the physician what type of water jet project was being performed at the time of the accident and the source of the water.

Operators using or working around high-pressure water systems need to take additional precautions, including specialized personal protection equipment. This and additional information on high-pressure water safety is provided by and available as a wallet card from:

Water Jet Technology Association

website: www.wjta.org

**Figure 1-24**

- Use the handgun wash-down system for final equipment and job site cleanups or for cleaning debris buildups on the inside of body.

**DANGER**

The water handgun operates at high pressure. Never point the water handgun at yourself or others. Make sure you are holding handgun securely with both hands, in a secure stance. Water gun has a kickback when turned on.

- Always bleed the pressure from the handgun before disconnecting it from the high-pressure handgun connection.
High-Pressure Water Safety and Hazard Warnings — continued

When setting up for rodding operations, use the appropriate guide fin and hose guard (tiger tail) to prevent the nozzle from turning in the pipe and returning toward the operator. The length of the assembled nozzle and guide fin must be greater than the diameter of the pipe to be cleaned.

Inspect the rodder hose often for indications of damage or wear. Check the hose before each use for movement in hose fittings, exposed hose reinforcement, kinking or collapsing, blisters or bubbles, and fittings that are improperly installed or cutting into the hose.

Waste Equipment Technology Association publishes a variety of industrial-related information that owners and operators can obtain. This material includes specifications, repair, and inspection information for high-pressure hoses used in connection with sewer/catch basin cleaning equipment.

Figure 1-25

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
</table>

Using improper fittings or using the sewer hose outside the sewer pipe can cause violent loss of control of the rodder hose.

The sewer hose creates tremendous pressure and must not be fitted with a reducer or hand-held nozzle or be operated outside the sewer pipe. The back pressure created by such action will cause loss of control of the hose. Violent movement of the hose and fittings or high pressure can cause severe injury or death.

All hose manufacturers have instituted a color code system for identification of the hose, fittings, and tools. When repairing a hose, the inside color of the hose, the color of the fitting, and the die colors must match. Fittings from one manufacturer will not properly crimp onto hose from another manufacturer. The outside color of the hose indicates the pressure rating of the hose and must match during splicing operations. Be aware of the operating pressures associated with the vehicle and the proper hose specifications for safe operation.

The handgun operates under high pressure. High-pressure water can cause serious injury or death.

Do not turn on the water pressure until the hose is fully inserted into the sewer pipe, then increase water pressure slowly as you feed the hose into the sewer pipe. Special safety equipment is required when operating the high-pressure handgun. Always wear safety toe shoes or boots (waterproof shoes or boots preferred), coveralls, face shield, safety goggles, and gloves (waterproof gloves preferred).
Dust Hazard and Explosion Prevention Safety

In a confined area, certain concentrations of dust in an otherwise normal atmosphere can explode when spark occurs. This phenomenon is known as a dust explosion. It has been known to occur in grain elevators, underground mines, flour mills, crushers, etc. The dust itself need not be an explosive or flammable substance.

The safe operation of transferring potentially explosive dust should be addressed by the following:

- Static charge dissipation
- Spark prevention

See “Static Charge Dissipation” on page 1-28 and “Spark and Fire Prevention Safety” on page 1-30 for specific information on addressing these two concerns.
Hydrocarbon Waste Recovery

![Safety Symbols](image)

| Chemical Burning Skin Hazard | Fire Hazard | Explosion Hazard | No Smoking | Never have an open flame |

Figure 1-28

**DANGER**
Do not vacuum flammable or explosive materials.

Never use a rotary lobe blower to vacuum materials with flash points below 150°F. However, hydrocarbon materials with flash points greater than 150°F may be picked up with a rotary lobe blower if the following four concerns are addressed:
- Controlling the lower explosive level (LEL)
- High temperature prevention
- Static charge dissipation
- Spark prevention

**DANGER**
It is not recommended that materials with a flash point below 150°F be picked up under any operating conditions. The potential for an explosion is too great.

A rotary lobe blower may be used to pick up materials with flash points greater than 300°F without addressing the four concerns.

Refer to API Standard 2219 for more information on safe operation of vacuum trucks in petroleum service.

## Controlling Lower Explosive Level (LEL)

Super Products recommends that a monitor for hazardous hydrocarbon concentrations be installed in the exhaust stream of the vacuum pump to continuously monitor for lower explosive level (LEL). The monitor must be properly calibrated based on the product being picked up.

For details on how the monitor operates, it is suggested you contact a reputable monitor manufacturer such as Industrial Scientific Corporation in Oakdale, PA at 1-800-338-3287.

If the LEL reading approaches 50%, it is recommended that the operator at the end of the work hose lift the hose out of the material being conveyed and allow only air to enter the vacuum hose. As an alternative, a bypass switch could be installed to open the two valves discussed in “High Temperature Prevention” on page 1-27.
High-Temperature Prevention

**DANGER**

Failure to comply with the recommendations for high-temperature prevention could result in equipment failure, personal injury, or death.

We suggest that in order to pick up materials with flash points below 300°F, primary and backup system sensors and air flow modifications to limit operating temperatures should be made to a standard vacuum system as manufactured by Super Products. They include the addition of two temperature gauges with adjustable switches, and two temperature sensors, which should be installed in the exhaust airstream of the vacuum pump. In addition, two air-operated valves should be installed on the body. The temperature sensors and gauges should be similar to a Murphy temperature “switch gauge” whereby a contact closes, permitting use of an electrical signal at temperatures above an adjustable preset temperature. The valves should have a minimum four inch diameter.

In operation, the operator should set the trip point of the temperature switches at or below the flash point of the material being picked up. If the exhaust temperature reaches the set point of the temperature switch, the valves would open. This would stop the conveyance of material through the vacuum hose, permit cool air to be sucked into the body and vacuum system for cooling the vacuum pump, and quickly vent from the body so as to not cause an explosion. Prior to each load being vacuumed, the operator should test each system to ensure the valves are working.

The operator should set the trip point of both Murphy gauges to the lowest possible setting, block off the intake hose, and operate the vacuum pump at a minimum of 1000 RPM until the temperature rises to the trip point. The operator should ensure that once the temperature has reached the trip point, the respective valve opens.

**DANGER**

Do not use the unit unless both temperature limitation systems are working properly.
Static Charge Dissipation

DANGER
Failure to comply with the recommendations for static charge prevention could result in equipment failure, personal injury, or death.

When picking up potential explosive materials (either hydrocarbons with flash points below 300°F, or explosive dust), it is necessary to safely dissipate static charges by completely grounding the vacuum truck, intake hose, and container from which the material is being removed. Only a static dissipating vacuum hose supplied by Super Products should be used. There should be a grounding strap run from the truck frame to a grounding stake. All grounding cables should be a minimum of 1/0 in size. Grounding lugs should be welded onto the male and female couplings of all hose sections so that grounding straps (min. #10 gauge wire) can be run from the male coupling to the female coupling at all connection points. A grounding reel should be installed on the vacuum loader with the ground cable run to the container from which the material is being removed.

When material is being transferred by a pneumatic conveying system, static electricity is generated. If this electricity is not dissipated through an electrical ground, arcing can occur. The resulting spark can cause a dust explosion or a hydrocarbon explosion either within the unit or within a building that the conveying line enters. The following safeguards are recommended to dissipate static charge caused by operation of the unit:

- Truck tires can insulate the unit; therefore, an electrical wire should be connected between the body and a known electrical ground such as a water pipe, plant ground loop system, or metal stake driven into the ground sufficiently deep to ensure an electrical ground. Bolt wire to truck frame — do not weld.
- The electrical resistance from the truck to the electrical ground must be at 10 ohms or less for the duration of the material transfer process. Some companies, such as Newson Gale, provide a ground verification system to enable operators to establish safe grounding of their vehicle.
- Supertube and hose couplers have rubber sealing gaskets. The presence of dirt and corrosion can prevent electrical conduction from tube to tube through the tube clamps. It is recommended to weld a bolt or a threaded stud to each end of each tube or hose coupler, and connect a wire of sufficient length from tube to tube after installation of the clamp. Wing nuts could assist in making these connections quickly.
- Standard Super Products material handling hoses are specially designed to conduct static electricity. Do not substitute hoses of unknown construction, particularly plastic hoses, which may not be static conducting.
- Never operate the unit inside a building that has a dust-laden atmosphere, such as inside of a grain elevator. The unit's electrical system and electrical components will arc in normal operation. Sparks and flame could also be emitted from the engine exhaust. Any of these conditions could cause a dust explosion within the building.
- Before operation, ensure that all ground wire connections are tight and free from corrosion and paint.

Failure to comply with the recommendations for static charge prevention could result in equipment failure, personal injury, or death.
Spark and Fire Prevention Safety

When picking up materials with flash points below 300°F, it is necessary to take precautions to prevent generating sparks. Explosion from spark ignition can occur when picking up an explosive product (solid or gaseous). Typically, sparks occur from material striking steel or when metal objects within the material, such as nuts, bolts, or nails, strikes a steel surface. This is especially prevalent where bends in the vacuum piping system occur or inside the collector body when material strikes the floor.

The suggested way of protecting from such an explosion is to use abrasive-resistant rubber-lined elbows where a bend occurs. Line the inside of the material deflector with a rubber abrasion-resistant material and partially fill the debris body with an extinguishing liquid, such as water, so the incoming material does not strike another object, causing a spark. The entire unit should be grounded, as described previously, and only static dissipating hoses should be used. It is essential the truck engine exhaust is directed away from the blower exhaust silencer to avoid an explosion caused by the hot gases or a spark from the engine exhaust.

The vacuum pump exhaust air should only enter the atmosphere at a minimum of 100 feet away from any other potential ignition source.

If the environment in which the truck sits has an explosive gas in the atmosphere, protective measures such as grounding all engine belts, explosive proof alternators, voltage regulators, special truck exhaust mufflers, engine run-away protection devices etc., must be used. Consult the truck manufacturer for details.

All of the above situations are extremely dangerous, and all precautionary steps must be taken or else equipment damage, personal injury, or death could occur. If there is any doubt as to the material to be conveyed, a complete analysis must be done prior to vacuuming.
# Debris Body Dumping Safety and Hazard Warnings

<table>
<thead>
<tr>
<th>WARNING</th>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEVER leave body raised or partly raised while vehicle is unattended or while performing maintenance or service under body unless body is propped to prevent accidental lowering. The debris body MUST BE empty for service work.</td>
<td>Use extreme caution when dumping contents of the debris body. Ensure all personnel are at least 20 feet away from truck. Select a dump site that is on level ground and is clear of overhead obstructions. Serious injury or death to the operator and/or bystanders could occur if precautions are not taken when dumping the contents of the debris body.</td>
</tr>
</tbody>
</table>

- Never prop a raised loaded debris body.
- Never attempt to raise body when vehicle is on unlevel ground.

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>Never go under a raised loaded debris body. Never go under a raised body without securely propping it. Body must be empty.</td>
</tr>
</tbody>
</table>

- Immediately report any damage or malfunction of the unit or components to your employer.
- Never ride, or let any other person ride, on any part of the vehicle other than in the cab.
- Make sure that all individuals and obstructions are clear of the hoist and body before operating the controls, and be ready to stop operation at any time that a hazardous condition might occur.
- Dispose of all waste in accordance with federal, state, and local laws and regulations.

- When positioning the truck at the dump station, choose an accessible location on level ground. Raising the debris body on unleveled ground increases the possibility of tipping.
- Make sure the area is clear of ground and overhead obstructions.
- Never raise the debris body unless you can clearly see all overhead structures. Stay clear of all utility lines.
- Do not dump the debris body over a pit area where the ground may cave in or is unstable.
- Use care when positioning the debris body to the dump station. Your vision, especially to the side and rear of the debris body, may be reduced by the size of the debris body. Use mirrors to aid vision. If you cannot see the dump site clearly, stop the truck and examine the area. If necessary, request assistance to guide you while backing the truck into position.
- Never drive with the debris body in the raised position. Traveling with the debris body in the raised position increases the chances of colliding with overhead obstructions. In addition, the center of gravity of the debris body is higher with a raised debris body, making the unit more prone to tipping over.
Sewer Gas Safety and Hazard Warnings

**WARNING**

- Sewer lines often contain poisonous or explosive gas such as methane. NEVER enter or bend over a sewer without proper ventilation and personal protective equipment. If another person needs help in a sewer, immediately call for emergency assistance. NEVER enter the sewer to help unless you have been trained to do so and have proper personal protective equipment.
- NEVER smoke in or around sewer lines, drains, or catch basins.
- Failure to follow these instructions may result in death or serious injury.

Confined Space Hazard

Follow all requirements for confined space when servicing. All large water bodies and vessels that can be entered are to be considered permit-required confined space as defined by the Occupational Safety and Health Administration (OSHA). The following information is from OSHA 3138-01R 2004. The full document can be obtained from www.osha.gov.

Many workplaces contain spaces that are considered to be "confined" because their configurations hinder the activities of employees who must enter into, work in, or exit from them. In many instances, employees who work in confined spaces also face increased risk of exposure to serious physical injury from hazards such as entrapment, engulfment, and hazardous atmospheric conditions. Confinement itself may pose entrapment hazards, and working in confined spaces may keep employees closer to hazards such as machinery components than they would be otherwise. For example, confinement, limited access, and restricted airflow can result in hazardous conditions that would not normally arise in an open workplace.

The terms “permit-required confined space” and “permit space” refer to spaces that meet OSHA’s definition of a “confined space” and contain health or safety hazards. For this reason, OSHA requires workers to have a permit to enter these spaces.

By definition, a confined space:
- Is large enough for an employee to enter fully and perform assigned work.
- Is not designed for continuous occupancy by the employee.
- Has a limited or restricted means of entry or exit.

These spaces may include underground vaults, bodies, storage bins, pits and diked areas, vessels, and silos.
Trenching Hazards

NOTE
Reference to OSHA regulations are for informational purposes only and not intended as legal advice.

OSHA Safety Tips

Working safely in trenches

Do NOT enter an unprotected trench!

Each employee in a trench shall be protected from a cave-in by an adequate protective system.

Some of the protective systems for trenches are:

- Sloped for stability; or
- Cut to create stepped benched grades; or
- Supported by a system made with posts, beams, shores or planking and hydraulic jacks; or
- Supported by a trench box to protect workers in a trench.

Additionally, excavated or other materials must be at least 2 feet back from the edge of a trench; and

A safe means of egress shall be provided within 25 feet of workers in a trench.

For more complete information:

OSHA 2276
2007 Revised

De-energize and Lockout Procedures

### WARNING

Workers can be seriously or fatally injured if machinery they service or maintain unexpectedly energizes, starts up, or releases stored energy.

### NOTE

Follow all requirements for PPE when servicing equipment.

De-energization and lockout refer to specific practices and procedures to safeguard employees from the unexpected energization or startup of machinery and equipment or from the release of hazardous energy during service or maintenance activities.

De-energization requires the authorized employee to turn off and disconnect the machinery or equipment from its energy source(s) before performing service or maintenance and to either lock out or isolate the equipment/components to prevent the release of hazardous energy (e.g., electricity, compressed air, high pressure fluid, etc.).

Lockout devices hold energy-isolation devices in a safe or "off" position. They provide protection by preventing machines or equipment from becoming energized because they are positive restraints that no one can remove without a key or other unlocking mechanism or through extraordinary means, such as bolt cutters.

To properly de-energize this equipment:

1. Lower the debris body and tailgate to the lowered transport position or onto the mechanical props to support the component.
2. Lower the boom (if equipped) to the storage position or to the lowest or ground position.
3. Place the transmission in the park position.
4. Set the parking brake.
5. Turn off the engine and remove the keys.
6. Switch the battery power off if the truck has a battery disconnect switch, or disconnect the battery ground cables.
7. Lock the truck doors and securely store the truck keys.
Hazards With Equipment Maintenance

**WARNING**
Avoid serious injury or death from component failure by keeping implement in good operating condition by performing proper service, repairs, and maintenance.

Before Performing Service, Repairs, and Maintenance on the Equipment
- **Stop pto and engine**, engage parking brake, lower equipment, allow all moving parts to stop, and remove key before dismounting from truck.
- **Place** debris body, tailgate, and boom in lowered position or securely block up with support props.
- **Wear safety glasses, protective gloves** and follow safety procedures when performing service, repairs and maintenance on the equipment.
- Allow components to cool before servicing or performing maintenance.
- **Avoid contact** with hot hydraulic oil tanks, pumps, motors, valves and hose connection surfaces.
- **Securely** support or block up raised framework and lifted components before working underneath equipment.
- **Follow instructions** in maintenance section when replacing hydraulic cylinders to prevent component from falling.
- **Stop and shut off truck** engine before doing any work procedures.
- **Use** ladder or raised stands to reach high equipment areas inaccessible from ground.
- **Ensure** good footing by standing on solid flat surfaces when getting on equipment to perform work.
- **Follow** manufacturer's instructions in handling oils, solvents, cleansers, and other chemical agents.
- **Do not** change any factory-set hydraulic calibrations to avoid component or equipment failures.
- **Do not** modify or alter equipment, functions, or components.
- **Ensure the equipment is cleaned appropriately. Sanitizing may be required if biological hazards are present.**

Performing Service, Repairs, Lubrication, and Maintenance
- **Inspect** for loose fasteners, worn or broken parts, leaky or loose fittings, missing or broken cotter keys, washers on pins, and all moving parts for wear.
- **Replace** any worn or broken parts with authorized service parts.
- **Lubricate** unit as specified by lubrication schedule.
- **Never** lubricate, adjust, or remove material while it is running or in motion.
- **Torque** all bolts and nuts as specified.

Safety Shields, Guards, and Safety Devices Inspection
- **Replace** any missing, broken, or worn safety shields, guards, and safety devices.
- **Replace** any damaged or worn safety warning decals. Damaged or worn decals need to be replaced with new ones.
Decal Location

In addition to the decals provided by Super Products there may be decals shown that are part of the cab and chassis or other non Super Products components; these will not be covered.

Some decals shown may appear in a different location than pictured due to differences in optional equipment on each machine and differences in cab and chassis configuration.

If any decal provided by Super Products is missing or becomes illegible, a replacement decal can be requested from Super Products at no charge and should be replaced immediately.

**WARNING**
Severing Hazard
Serious injury or death may occur by placing body extremities into rotating blower. Tools and objects placed into inlet may cause damage to blower.

Part no. 3050-00479
Figure 1-39

**WARNING**
CRUSHING HAZARD
- Do not stand behind machine when dumping.
- Do not go under tailgate unless the props are in support position.
- Failure to follow these procedures could result in serious injury or death.

Part no. 0003403
Figure 1-43

**DANGER**
Entanglement Hazard
To avoid serious injury or death from a rotating shaft:
- Do not go under the vehicle when the engine is running.
- Do not work on PTO or shaft (with or without a guard) when the engine is running.
- Do not engage or disengage the PTO or driven equipment by hand from under the vehicle when engine is running.
- Always shut the engine off before working on or near the system.

**WARNING**

**CRUSHING HAZARD**

Do not go under a raised body unless the body support is used. Failure to do so could result in serious injury or death.

**DEBRIS BODY SUPPORT OPERATION**

To use:
1. Confirm debris body is unloaded before using support.
2. Raise body sufficiently to allow support to be swung into position.
3. Swing support into support position.
4. Visually confirm that support is secure before performing any work.

To store:
1. Raise debris body slightly.
2. Return support to transit position.

FREEZE PREVENTION REFERENCE GUIDE

Air Purge
It is often beneficial to purge the water from all water lines to prepare for freezing temperatures and before using the anti-freeze injection system. The Mud Dog is equipped with an integral air purge line and ball valve located under the main control panel. To purge the water from the system:
1. Drain all water from the water tanks.
2. Open the drain petcock on the water pump inlet.
3. Move the inlet strainer cup.
4. Open the bypass valve.
5. Connect the handgun to the water hose. Remove the lance from the handgun.
6. Open the air purge ball valve.
7. Point the handgun in a safe direction and pull the trigger until no more water comes out.
8. Close the air purge ball valve and wait 2 minutes to let the system air supply recover. Then repeat the previous step.
9. Open the drain petcock at the water pump outlet.
10. Open the drain petcock below the bypass valve.
11. Turn the water pump on for 1 second only. This helps purge water out of the pump manifold.
12. Close the air purge ball valve.
13. Close all drain petcocks when all water is purged.

NOTE: Never depend only on blowing the water out of your system as not all the water will drain from the heater and could freeze causing heater coil damage.

Winter Recirculation System
In freezing temperatures, it may be necessary to recirculate the water through the system to avoid freezing. To accomplish this:
1. Remove the lance from the handgun and connect the hose to the Winter Recirculation quick disconnect fitting located near the bypass valve. Make sure the bypass valve is closed.
2. Engage the hydraulic pump PTO switch inside the truck cab.
3. Then turn on the winter recirculation switch on the control panel. Water will circulate through the entire system both when you are traveling and when stationary.
4. If desired, the water heater may be turned on to warm up the circulating water. The water temperature of the circulating water should never exceed 120°F Fahrenheit (54°C Celsius).

Anti Freeze System
The anti-freeze system is used to prevent freeze-ups of the water pump, water heater and water pipes located inside the cabinet. RV antifreeze (propylene glycol) should be used instead of automotive antifreeze since it is environmentally friendly and less expensive. The anti-freeze originally supplied with your Mud Dog is a high performance RV that stays liquid down to -50°F (6°C) and has burst protection down to -10°F (-12°C). Regular RV antifreeze will start to turn cloudy at -10°F (-23°C) and has burst protection down to -50°F (-50°C). Follow the procedure as listed:
1. Open the water supply drain valve located at the rear of the truck or between the cabinet and the driver’s side. Completely drain the water tanks.
2. Confirm the antifreeze supply line valve is closed.
3. Remove the inlet strainer cup and screen.
4. Open the water inlet valve. Drain completely.
5. Close the water inlet valve.
6. Replace the inlet strainer cap and cup.
7. Open the antifreeze supply valve.
8. Close the water tank return drain valve, manifold drain valve, and bypass valve.
9. Disconnect the hose from the handgun.
10. Connect the hose to the high pressure water hose from the reel.
11. Confirm the Winter Recirculation switch is off and flow control dial is at zero.
12. Start the engine and engage the hydraulic pump.
13. Direct the handgun away from persons, pull and hold the trigger.
14. Engage the water pump. (Winter Recirculation Switch On)
15. Observe the water discharging from the handgun. When the discharge turns the color of the antifreeze being used, release the handgun trigger.
16. After releasing the handgun trigger, open the high pressure water bypass valve a few seconds to send antifreeze through the return to tank line.
17. Disengage the water pump. (Winter Recirculation Switch Off)
18. Disengage the hydraulic pump and shut off the engine as described in the manual.

NOTE: Periodically the strength of the antifreeze should be checked and replaced as required to prevent freeze-up based on your low temperature as it does get diluted each time it is used.

The water system is now protected from freeze-up during periods of non-use in cold weather.

Debris Body Tailgate Props

**DANGER**

Always position the tailgate props in the proper position before entering any area beneath the debris body tailgate or entering the debris body. Failure to do so could result in serious injury or death.

**Unlocking the Tailgate Props and Raising the Debris Body Tailgate**

1. Ensure the tailgate area is clear of people and obstructions.
2. Remove the retaining pins (1) from both tailgate props (2). Allow the tailgate props to rest on the tailgate pins (3).
3. Unlock and raise the debris body tailgate. The tailgate props will maintain their aligned position with the tailgate pins.
4. Lower the debris body tailgate enough so that the tailgate pins rest against the tailgate props.

![Figure 1-84](image)

5. Shut the truck engine off and remove the keys.

**Lowering the Debris Body Tailgate and Storing the Props**

1. Ensure the area is clear of people and obstructions before lowering the debris body tailgate.
2. Raise the debris body tailgate off the tailgate props.
3. Return both tailgate props to their stored position and install the retaining pins.
4. Lower and latch the debris body tailgate.

![Figure 1-85](image)
Preparation Before Traveling to Worksite

If there are any questions on how to implement the below procedures, contact Super Products prior to starting operation. Super Products will not be responsible for any damage or injuries if all safety procedures are not completely followed.

1. Perform required maintenance as specified in the Maintenance Schedule section of this manual.
2. Check the oil and water levels in the engine, transmission, and fuel.
3. Close all water drain valves and install all plugs and strainers previously removed.
4. Make sure the boom is in transport position and properly secured.
5. Make sure the tailgate is closed and properly locked.
6. Make sure all tools, accessories, and work tubes/hoses are properly secured.
7. Make sure all cabinet doors and access panels are closed and there are no loose items on the truck exterior.
8. Make sure the final filter is clean and that the access cover is secure.
9. Make sure the fresh water fill pipe strainer is clean.
10. Close the water tank drain valve located above the rear bumper.
11. Conduct a complete truck walk-around to visually inspect the truck for damage, leaks, or unsafe conditions.
12. Check all lights for proper operation.
13. Set the brakes and place the transmission in neutral.
14. Check the engine oil, coolant, windshield washer fluid, and transmission fluid. The truck must be running to check the transmission fluid.
15. Turn the ignition key to off.
16. Check both vacuum pump sight glasses. They should be half full on level ground.
17. Make sure the Y-strainer is clean and the cap is on the drain.
18. Make sure the cyclone separator is clean.
19. Make sure the hydraulic fluid reservoir is full, showing halfway up on the sight glass.
20. Make sure the debris tank is lowered, the debris tank door is locked, and all clean-out ports and drains are closed.
21. Make sure the body flusher handle is closed.
22. Make sure the ejector plate is retracted and the HOME switch on the curbside panel is lit green.
Introduction
This manual contains important information regarding safe operation, adjustment, and maintenance for the Super Products’ Mud Dog® Vacuum Excavator.

DO NOT allow anyone to operate or service this machine until they have read and understood all aspects of this manual.

DO NOT use this machine for any purpose or application other than those listed in this manual. Improper use or neglect of safety precautions will cause serious injury or death. Refer to Section 1, Safety.

NOTE
This operator’s manual is to stay with the truck and be used as reference for operator personnel.

Principles of Operation
The Mud Dog is designed for removing soil from around utilities such as gas, water, electric and telephone lines as well as in industrial plants for exposing buried lines of any nature. It can be used for "pot holing" on horizontal directional drilling sites. It also can be used to dig post holes for telephone and electric poles as well as many other applications.

The unit uses a water system for breaking up the soil and a vacuum system to remove the soil.

The vacuum system utilizes a positive displacement “Roots” type vacuum pump which is driven by the truck engine through a transfer case. Material is picked up at the end of a suction tube and pneumatically conveyed into a collector body. The vacuum hose is supported by a boom which, at the operators discretion, can be raised, lowered, extended, retracted or rotated left or right. As material enters the collector body, the majority of the material falls out into the body because of gravity and the tremendous reduction in air velocity. An air-backed elbow allows the material to make a 90° bend as it enters the body while minimizing elbow wear.

The air exits the body at the top front section where the ball float is located. The ball float will shut off the air system when picking up materials with enough of a liquid content to float the ball and therefore prevent overfilling the unit.

Any material or mist still airborne will then enter a centrifugal separator which is located just forward of the large storage compartment on the left side of the unit. Centrifugal force causes the airborne materials to be separated from the air stream with the material falling into a storage compartment located at the bottom of the separator and the clean air exiting out the top of the separator.

The air then enters a "final filter" which is a pleated element capable of ten (10) micron filtration which will capture any remaining carryover dust.

The clean air then enters the vacuum pump and then exits out of the vacuum pump through a high efficiency exhaust silencer and into the environment.

The Mud Dog™ is designed to pick up wet materials as well as slurries. If picking up dry materials that are dusty, you must wet the material down to limit the carryover into the separator and final filter.

Equipment Specifications
Maximum vacuum pressure rating of vacuum system = 27" Hg (0.90 bar)
Maximum pressure rating = Not Applicable. This unit is not designed for pressure unloading.
Maximum pressure of water system = 3,000 psi (207 bar)
Maximum pressure of air system (optional air-excavation system) = 175 psi (12 bar)
Maximum height in transport configuration = 13’-4” (4,064 mm)
Maximum height with boom raised and extended = 28’-6” (8,687 mm)
Approximate empty weight of stock MD1200 = 43,880 lbs (19,904 kg)
Approximate empty weight of stock MD1600 = 48,500 lbs (21,999 kg)
Vacuum System

The vacuum system utilizes a positive displacement type of vacuum pump that is mechanically driven from the truck’s engine. The vacuum system has the capability of transferring materials using two methods — Pure Vacuum and Air Conveyance.

**CAUTION**

The vacuum system is designed for liquids, slurries, and damp materials. Dry or dusty materials must be wet down before vacuuming to limit the carryover of debris into the separator and final filter. This can be accomplished with the handgun attachment or by injecting water into the vacuum line with the liquid ring accessory.

Pure Vacuum

As a general rule, pure vacuum would be used for removing sludge from beneath liquid or for rapid liquid loading. In this mode, the vacuum tube is totally submerged in the liquid and only material (no air) transports through the line. With the standard vacuum pump, the maximum distance from the top of the vacuum hose supported by the boom to the liquid surface cannot exceed three hundred sixty-seven (367) inches (30.5) feet at sea level assuming water as the liquid. For materials of a higher density than water, these figures must be reduced. Consult the factory for additional information. In pure vacuum mode, select the transmission gear that is 1:1 ratio (16th gear for 18-speed transmission, 9th gear for 10-speed) or lower. The vacuum pump should be operated at one thousand two hundred (1200) RPM. Operating the unit too fast will decrease performance. Loading rates up to one thousand (1000) GPM through a six (6) inch hose can be realized.

Air Conveyance

The second conveying method is "air conveyance" and requires enough air velocity going past the material to be picked up to capture such, and convey through the vacuum tube to the body. This requires the vacuum pump be operating at a fast enough speed to produce the required airflow to capture the material.

**NOTE**

It should be noted that the most efficient and highest loading rate occurs when the pump is run as slow as permissible and still pick up the material. Vacuum tube lengths up to one thousand (1000) feet can be used and liquid loading rates up to five hundred (500) GPM through a six (6) inch line can be realized. Select the overdrive transmission gear (18th gear) for air conveyance mode.

**IMPORTANT**

There are also applications where a vacuum fluidizing nozzle should be used. This combines the benefits of pure vacuum and air conveyance. The fluidizing nozzle has the ability to remove sludge from beneath liquids where the distance exceeds the limitation of pure vacuum.

**NOTE**

It should be noted that for maximum efficiency, all vacuum line connection points must be air tight. This is accomplished by installing the O-ring gasket over the male end of the tube. Refer to the "Operation Instructions" and "Maintenance Schedule" for further details.

It should also be noted that the vacuum pump should never be operated above a pump exhaust temperature of 320°F. Deviations from this maximum operating temperature must be approved by Super Products.

The vacuum system is designed for liquids, slurries, and damp materials. Dry or dusty materials must be wet down before vacuuming to limit the carryover of debris into the separator and final filter. This can be accomplished with the handgun attachment or by injecting water into the vacuum line with the liquid ring accessory.
Airflow

Please refer to below drawing.

1. Material along with air enters body through top air backed elbow (#1).
2. Air speed is greatly reduced inside body allowing material to separate from air stream. Material settles to the bottom of the body. Air with some fine carryover dust or mist exits body past float ball. (#2).
3. Float ball (#2) acts as vacuum shutoff when body becomes full of liquids.
4. Air exits the body through a hose (#3) and enters the cyclone separator (#4) located on left side of unit.
5. Air is spun centrifugally with majority of carryover dust and mist setting to bottom of separator area.
6. Air continues out the top of the separator (#5) over to the final filter (#6).
7. The air goes from the outside of the filter (#6) to the inside of the filter. Any remaining material, ten microns or larger is captured on the outside of the filter.
8. The air goes through the final filter (#6) and into the inlet of the vacuum pump (#7).
9. The air goes horizontally through the vacuum pump where the air normally gets heated up because of the work being done on the air by the vacuum pump. The amount of heat being generated depends on operating vacuum and pump speed.
10. The air exits the vacuum pump (#7) and goes through a discharge silencer (#8) before entering the atmosphere at the top of the silencer.
11. To keep high vacuum blowers cool, there will be an inlet silencer bolted directly above the vacuum pump (#7). Cooling air comes from the atmosphere into the top of the silencer and on into the vacuum pump. This air cools the vacuum pump allowing for high vacuum.
Vacuum Pump Operation

1. The vacuum pump is driven through a transfer case. For vacuum pump operation, the rear drive axle is disengaged and the vacuum pump is engaged. The transmission should be in neutral, parking brakes engaged and wheel chocks properly positioned before beginning the engagement process.

- **CAUTION**

Failure to engage parking brakes and/or position wheel chocks could result in unexpected chassis movement which could cause bodily injury or property damage.

2. Start engine and allow it to idle. Let chassis air build to the maximum 120psi.

3. The truck is equipped with a "throttle enable" switch located on the chassis instrument panel. Move this switch to the "on" position.

4. Transfer Case/Vacuum Pump Engagement
   - Methods of engagement vary with the chassis transmission and transfer case equipment. Select the section below that matches the configuration of the unit being operated. The standard configuration is manual transmission with manual shift transfer case.
   - Manual Transmission with Manual Shift or Air Shift Transfer Case.
     - a. Fully depress the clutch pedal.
     - b. Shift transmission into high range.
     - c. Put the gear shift in reverse.
     - d. Locate the lever between the driver's and passenger seat labeled "Rear Axle". Pull up on the lever until it is fully engaged. It may be necessary to feather the clutch in order to get full engagement. A green light will come on indicating the rear axle is disengaged.
     - e. Locate the PTO control on dash for the hydraulic pump. Move PTO control switch to the engaged position. If the unit is equipped with an optional air shift transfer case, locate the valve or switch (respectively) labeled "Rear Axle" or "Vacuum Pump" between the driver's and passenger seats or on the instrument panel. Move the valve or switch to the "engaged" position.
     - f. Let out the clutch momentarily two (2) to three (3) seconds.
     - g. Depress clutch again and select the proper forward gear. The proper gear should be the highest forward gear which will keep the engine speed above 1000 RPM at the desired vacuum pump speed.
     - h. Slowly release the clutch, the vacuum pump will be turning at this time.

- **CAUTION**

Make sure no one is near the end of the vacuum hose and that the vacuum relief door is open before engaging the vacuum pump. Failure to do so could cause personal injury.
• Automatic Transmission with Manual Shift or Air Shift Transfer Case.
   a. Confirm that the transmission gear selector is in the neutral position. Never shift the transfer case with the transmission gear selector in the drive "D" or reverse "R" position. Damage to the transfer case can result if the transfer case is shifted while the transmission is in gear.
   b. Locate the lever between the driver's and passenger seat labeled "Rear Axle". With the transmission in neutral, pull up on the lever until it is fully engaged. If it does not fully engage, it will be necessary to pull up lightly on the lever during the next step. Pull up lightly on the lever while momentarily placing the transmission gear selector in drive "D" position. Immediately return the transmission gear selector to the neutral "N" position. A red light will come on indicating the rear axle is disengaged.
   c. Locate the PTO control on dash for the hydraulic pump. Move PTO control switch to the engaged position.
   d. If the unit is equipped with an optional air shift transfer case, locate the valve or switch (respectively) labeled "Rear Axle" between the driver's and passenger seats or on the instrument panel. Move the valve or switch to the "engaged" position.
   e. Place the transmission gear selector in the forward drive "D" position. The vacuum pump will be turning at this time.

7. Transfer Case/Vacuum Pump Disengagement
• Manual Transmission with Manual Shift or Air Shift Transfer Case.
   a. Fully depress the clutch pedal.
   b. Wait five to ten seconds for the driveline and vacuum pump to stop turning.
   c. Locate the lever between the driver's and passenger seat labeled "Rear Axle". Push down on the lever until it is fully disengaged. It may be necessary to feather the clutch in order to get full axle engagement. The green light will go out, indicating the rear axle is engaged.
   d. Locate the PTO control on dash for the hydraulic pump. Move PTO control switch to the disengaged position. If the unit is equipped with an optional air shift transfer case, locate the valve or switch (respectively) labeled "Rear Axle" or "Vacuum Pump" between the driver's and passenger seats or on the instrument panel. Move the valve or switch to the "disengaged" position.
   e. Shift to neutral and slowly release the clutch.
   f. The vacuum pump should not be turning at this time.

• Automatic Transmission with Manual Shift or Air Shift Transfer Case.
   a. Place the transmission gear selector in the neutral "N" position. Never shift the transfer case with the transmission gear selector in the drive "D" or reverse "R" position. Damage to the transfer case can result if the transfer case is shifted while the transmission is in gear.
   b. Locate the lever between the driver's and passenger seat labeled "Rear Axle". With the transmission in neutral "N", push down on the lever until it is fully engaged. If it does not fully engage, push down lightly on the lever while momentarily placing the transmission gear selector in drive "D" position. Immediately return the transmission gear selector to the neutral "N" position. The green light will go out, indicating the rear axle is engaged.
   c. Locate the PTO control on dash for the hydraulic pump. Move PTO control switch to the disengaged position. If the unit is equipped with an optional air shift transfer case, locate the valve or switch (respectively) labeled "Rear Axle" or "Vacuum Pump" between the driver's and passenger seats or on the instrument panel. Move the valve or switch to the "disengaged" position.

5. At the main control panel, wireless remote, or pendant increase the vacuum pump speed to the desired level as observed on the tachometer in the main control panel. Run the vacuum pump at the slowest speed possible to reduce fuel consumption and wear, limit carryover and have a quieter machine. To maintain proper lubrication, do not run the vacuum pump slower than 900 RPM. Never exceed 2000 RPM with the vacuum pump engaged. When it is time to vacuum material, close the vacuum relief door by operating the switch on the wireless remote or pendant. The vacuum relief door switch on the main control panel must be in the "closed" position for the vacuum relief door to close.

6. When done vacuuming, open the vacuum relief door. Reduce the engine speed to idle.

8. Move the throttle enable switch to the "off" position.

Make sure no one is near the end of the vacuum hose and that the vacuum relief door is open before engaging the vacuum pump. Failure to do so could cause personal injury.
Vacuum Relief Valves

Super Products offers two (2) types of vacuum relief valves. The in-line "T" type vacuum relief valve is delivered with the unit as optional equipment and its operation is described in this procedure. The remote operated vacuum relief valve is standard. It consists of a hinged door which is opened/closed by a pneumatic cylinder. The cylinder is controlled by the operator at the control panel or the pendant remote or the wireless remote. Its operation is also described in this procedure.

- Always use emergency "T" type relief valve, except as noted in item six (6) below.
- When safety person is used, make sure he/she is in full view of person(s) at end of vacuum hose.
- When working close to end of hose, wear tight fitting clothes. Keep shirts and jackets closed so that shirt tails and jacket tails will not be pulled into end of hose. Remove loose fitting jewelry such as bracelets and necklaces unless they are under tight fitting clothing.
- Do not use hand or foot to remove obstructions from end of hose.
- Keep all body extremities and clothing from end of hose.
- The only time the emergency "T" type relief valve is not required is when the operator is working vertically off the boom hose. In this case only, the operator should use the remote operated relief valve as described elsewhere in this manual section. Otherwise, use only the emergency relief valves approved by Super Products. Failure to comply with this requirement could cause bodily injury, for which Super Products will not be responsible.

Operating Instructions - “T” Type Vacuum Relief

See section on "Testing of T" type vacuum relief valve before using due to possible personal injury or death.

CAUTION

If person operating at end of vacuum hose is in a confined space or for any other reason cannot easily reach pull cord on their safety belt, there must be a safety person(s) wearing safety belt with pull cord attached who must be in a position to view person(s) working at end of vacuum hose.

WARNING

If vacuum relief valve is not working properly, personnel should not be allowed to work at end of vacuum inlet hose due to possible injury or death.

WARNING

See section on testing of remote operated vacuum relief valve before using due to possible personal injury or death.

WARNING

Never move close to the end of any vacuum hose unless the safety person has the remote and is in a position to observe all operators. Failure to comply with this could result in serious personal injury or death.

WARNING

If vacuum relief valve is not working properly, personnel should not be allowed to work at end of vacuum hose due to possible personal injury or death.

CAUTION

Never work beyond the distance from the truck that the wireless remote control was previously tested at. Failure to comply could result in equipment not properly operating.
Suction Line Connections

Super Products hose-to-hose and hose-to-tube connections provide for fast set up of suction lines. This is achieved by providing loose fitting male and female ends of each length of suction hose or Supertube aluminum suction tube. The loose fit allows for quick and easy assembly. An O-ring gasket is placed over the male coupler before assembly to female coupler to eliminate air leaks. A locking secures the ends together and snaps overcenter.

This coupler system is used on all four (4), six (6) and eight (8) inch diameter suction line systems. In determining the best overall suction line set-up, the following facts should be considered:

1. Larger hose diameters provide greater loading rates.
2. Loading rates are reduced as conveying distance is increased.
3. Physical effort required relative to hose size:
   a. Four (4) inch diameter hose and smaller can be handled by one (1) man with minimal rest periods.
   b. Six (6) inch diameter hose can be handled by one man but requires frequent rest periods. Normally two (2) men will alternate or multiple smaller hoses are used at work area.
   c. Eight (8) inch diameter hose can not be handled by the average man without great physical exertion. Normally fed with shovels, wheel barrows or multiple smaller hoses.
4. The chart below gives the recommended normal particle size range for each hose diameter. Occasional particles larger than those indicated below can be handled.

<table>
<thead>
<tr>
<th>Hose Diameter</th>
<th>Particle Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>8&quot;</td>
<td>3&quot;</td>
</tr>
<tr>
<td>6&quot;</td>
<td>2&quot;</td>
</tr>
<tr>
<td>4&quot;</td>
<td>1&quot;</td>
</tr>
<tr>
<td>2.5&quot;</td>
<td>0.5&quot;</td>
</tr>
</tbody>
</table>
5. Bends reduce loading rates significantly. Straight runs with a minimum number of long radius bends made with smooth bore suction hose are the most efficient.

Suction Line Set Up Guidelines

1. Install relief valve as shown in this manual.
2. Use largest diameter suction line possible. Performance is affected by material handled, Mud Dog™ model, and crew size. Use Supertube for straight runs and hose for bends and material pick-up.
3. When using Y connectors, branch from eight (8) or six (6) inch diameter main suction line to multiple four (4) inch hoses whenever possible. An average person will achieve higher loading rates over the period of a full shift using four (4) inch diameter suction hoses.
   a. Minimize length of all suction lines.
   b. Minimize number of bends in all suction lines, use of Supertube reduces excess bends.
   c. Install permanent access ducting in area to be cleaned frequently.
Water System

The Mud Dog’s water system consists of water tanks (1) saddled along the side of the debris body. A water pump (2) including a suction line shut off valve (3) and strainer (4) is located inside the large cabinet on the left side. This pump is hydraulically driven and includes flow controls to regulate the output of the water pump. The pump is protected by a relief valve (5) which limits the maximum pressure. The water then flows into a hose reel which has 1/2” hose (7) stored onto it. A water lance handgun (8) with extensions (9) gets attached to the hose and a nozzle (10) is placed onto the end of the lance. The water system is used to loosen soils as well as for general cleanup. Various nozzles are available depending on soil conditions. A drain valve allows for draining the tank (12).

For working in freezing conditions and for digging in difficult soils, the unit is equipped with a water heater (11) which is located inside the large compartment on the left side. This heater is diesel fuel fired and can heat the water up to 200°F depending on the model of the heater and the water flow setting. The heater has a thermostat for adjusting temperatures. The heater kicks on only if there is water flow through the heater.

The system includes a water recirculation system to allow you to circulate water through the pump and back to the tank to prevent freeze-up. This can be used while you are traveling or when stationary.
Chapter 3

Control System Operation

Control Panel

The control panel is located inside the main cabinet and contains a number of gauges and controls. Standard gauges include:

- Vacuum Gauge - indicates vacuum at the blower.
- Service Hydraulic Filter indicator light - change in-tank hydraulic filter when lit.
- Cabin Heater Switch - turns on dual cabin heater fans, three speed settings.
- LCD Display
  - Blower Tachometer
  - Engine Tachometer
  - Fuel - percent in fuel tank & instantaneous gallons per hour
  - Press Mode button to view blower hour meter
- Winter Recirculation Switch
- Dump/Dig Mode switch
  - Dump mode enables dumping functions
  - Dig mode enables boom functions
  - Water control is available in both modes
- Vacuum Relief switch
- Water Heater switch - must be ON to allow remotes to turn on the water heater
- Boom Lights switch - (optional)
- Work Lights switch - turns on lights above tailgate
- Cabin Lights switch
- Variable Water Flow dial
- Variable Vacuum dial
- Boom Function buttons

The socket for the pendant remote control plug in is on the bottom side of the control panel. Plugging in the wired pendant remote will disable the wireless radio remote.
Emergency Stop

There is an emergency stop switch button located on both the left and right side of the main cabin. Pressing one of these large red buttons will:

- Open the vent door
- Halt all hydraulic functions
- Bring the engine to an idle

Pressing this button will relieve vacuum from the blower system, but will not disengage the blower from the engine.

After pressing the STOP button the operator should take a few minutes to fully assess the situation and correct any hazards or safety issues. Note, the engine will not restart until both STOP buttons are reset. Reset by twisting or pulling.

Emergency Stop (E-Stop) Button on Remotes

The E-Stop button is the small red button in the top middle of both the wired pendant and the wireless remote pendant.

Pressing the small red E-Stop button on either remote will:

- Open the vent door
- Halt all hydraulic functions
- Bring the engine to an idle

NOTE

*Pressing this button will not disengage the blower from the engine and will not kill the engine.*
After pressing the E-Stop button the operator should take a few minutes to fully assess the situation and correct any hazards or safety issues.

After pressing the E-Stop button on either remote it will be necessary to reset the control system by turning off the remote throttle switch in the cab, wait five seconds, and then turning the remote throttle switch back on.

**Control Valves**

All boom and body functions are controlled by an electric/hydraulic control valve which is located on the upper right hand corner of the body. This control valve includes a proportional hydraulic valve that delivers variable hydraulic oil flow depending on the function being used.

To manually override any of these functions, follow this procedure:

- Turn in proportional control valve clockwise several turns (pressure gauge should read 1600 to 2100 psi).
- For cartridge valves, push in outer pin then push or pull Knurled Collar for desired function. For D03 Valves, push spool left or right with small Allen key.
- Turn out proportional control valve until pressure gauge reads less than 200 psi.

**Water Control Valve**

The main water pump speed is controlled by an electric proportional hydraulic valve. This valve is mounted next to the hydraulic motor that is coupled to the main water pump. The valve receives a signal from the control panel that turns on and adjusts the speed of the pump. To manually override this valve, insert a 3mm hex key into the end of the proportional control cartridge and turn clockwise to temporarily increase oil flow without electric power. Turn counter-clockwise to decrease flow to zero.

---

**CAUTION**

All valve functions and operation are identified. Make sure you understand all functions and operations before operating unit. Failure to do so could result in equipment damage or personal injury.
Draft Pump Control (Optional)

When the truck is equipped with the optional draft pump (a.k.a. charge pump, liquid transfer pump, or water fill pump), an additional directional control valve is mounted next to the draft pump. This manual control valve sends hydraulic oil to either the main water pump or the draft pump or back to the hydraulic reservoir. A relief valve and a flow control valve are also provided to protect the draft pump.

To operate the draft pump:
1. Pour 2 quarts of water into pump to prime pump. It is not necessary to prime the suction hose.
2. Connect outlet to water tank fill with jumper hose.
3. Connect inlet to suction hose with strainer at end.

NOTES

Water level must be within 25 vertical feet of pump inlet.

4. With truck engine at idle, pull spool valve lever to "draft pump" or "charge pump".
5. When tanks are full, return spool valve lever to main water pump position.

Boom Operation

1. Start truck engine and allow to idle. Make sure parking brake is set and wheel chocks positioned. Place transmission into neutral.

2. Turn the "Remote Control" switch on the instrument panel to "ON". The boom is operated off the main hydraulics so the hydraulic system must be engaged.
3. Inside truck cab, locate the PTO control for the hydraulic pump. With engine at idle, fully depress truck clutch pedal and move PTO control switch to the engaged position.
5. Make sure boom hose transport lock, if equipped, is released first before operating boom.
6. At the control panel, in the main storage cabin, locate the six boom control buttons. Simply press one of the buttons to make the boom go up, down, left, right, extend or retract. Boom will swing 320° clockwise from transport position. A mechanical stop will automatically limit the maximum swing. The control panel is meant to be a back-up station to either a hand held pendant or a wireless control.

7. Connect required intake tubes onto intake hose. Make sure gaskets are positioned on couplings and over center clamp is fully closed. Use shortest possible length of tubing to ensure most direct route.

CAUTION

Failure to do so could result in truck rolling forward or backward resulting in potential personal or property damage.

CAUTION

When swinging boom, make sure you are aware of where all other personnel in the area are and that swing path for the boom will not hit any obstruction. Failure to comply could result in personal injury and/or property damage.

DANGER

When operating the boom, make sure you watch for overhead electrical wires or anything else which could result in personal injury or property damage.
8. When finished using the boom, position the boom to the transport position before moving the truck. Make sure the boom arm is in contact with the boom rest. When applicable, connect the hose hold-down latch to the hose. Extend the boom until the boom hose is slightly taught so it does not bounce around when transporting the unit.

9. Disengage the hydraulic system PTO located inside the cab by pushing the clutch pedal down and disengaging the PTO.

Water Lance Operation

Your unit is equipped with a water system to be used for loosening soils to make them easier to vacuum, to wet down dry materials, to limit carryover into the separator or final filter and for general clean-up. WARNING: Never point the discharge flow of water from the lance toward a person as serious injury could result. Always make sure your feet are firmly planted and you are securely holding the lance with both hands before operating the lance.

1. Start truck engine and allow to idle. Make sure parking brake is set and wheel chocks positioned. Place transmission into neutral.

2. Inside truck cab, locate the PTO control for the hydraulic pump. With engine at idle, fully depress truck clutch pedal and move PTO control switch to the engaged position.

4. Turn the remote control switch located inside the chassis to the "on" position.

5. Make sure the suction line strainer is installed and the quarter turn suction line valve is open.

6. Pull out the hose from the spring return reel located in the main cabinet and attach the lance gun and the appropriate extensions and work nozzle.

7. If equipped with the optional draft pump, ensure that the manual control valve lever is in the "main water pump" position.

8. Turn "on" the water pump by either turning the water pump speed dial on the control panel clockwise to desired water pump speed; or press water increase button on the remote control. Press the water increase button several times or hold down the increase button until desired pump speed is reached. The control system obeys the most recent command from either the remote control or the speed dial. For this reason, it is possible for the pump to be running while the speed dial is OFF. Set the water pump speed to correspond to the job being done so you have the proper flow and pressure.

9. Firmly grab the lance with both hands and point in the direction of the work to be done. Squeeze the trigger on the lance and water will come out of the end. Releasing the trigger will shut off the flow of water through the lance.

10. When done using the lance, shut the water pump off by either turning the water pump speed dial fully counter clockwise or by pressing and holding the water DECREASE button on the remote control.
11. Disengage the hydraulic pump from inside the chassis by depressing the clutch pedal and operating the PTO switch for the hydraulic pump to disengage it.

12. Point the lance in a safe position and pull the trigger to release any pressure inside the line. Once the pressure is reduced to zero, you can disconnect the extensions and lance from the hose.

13. Store the hose and lance, with extension, in the proper location.

14. Turn "off" the remote control switch before moving the truck.

**CAUTION**

Never exceed the pressure rating of your system. Super Products supplies systems rated at 2500 and 3000 PSI. Know which system you have. If any questions, contact Super Products. Failure to comply could result in personal injury or property damage.

---

### Water Heater Operation

Hot water is very beneficial when cutting through frozen material or certain soil types such as clay. The water heater system will work in either Dig or Dump mode. To turn on the water heater:

1. The truck must be in work mode (Remote Control/Throttle switch on). The Remote Control SW input LED is lit and the Remote Control output LED is lit inside the control panel.

2. The hydraulic system PTO must be enabled. The PTO Confirm Hyd LED is lit on the chassis module.

3. There must be water in the tanks and the Hydro-X system configured for digging with the wand.

4. Turn the Water Heater switch on at the control panel. The Water Heater SW LED is lit.

5. Assure the service switch at the water heater is turned ON. The water heater thermostat should be set for 130 deg F.

6. Turn on the water pump and adjust the speed to at least medium speed.

7. On the pendant, turn on the heater by pressing Shift and Heater ON buttons simultaneously.

8. Press and hold the dig wand trigger to start the water flow. The Water Heater EN LED is lit. The Water Heater EN signal enables the water heater relay (RY3) which sends power to water heater. When the Water Heater EN signal passes through the thermostat switch and the water flow switch(s), the water heater should fire. The heater burner will go through an ignition sequence.

9. The water heater will now fire whenever water is flowing through it. Releasing the trigger on the dig lance handgun stops water flow and shuts off the water heater burner. To turn off the water heater, press and hold down the yellow shift button and simultaneously press the heat OFF button on the remote. The water heater will go through its shutdown sequence to properly turn off the burner.

### Winter Recirculation System

1. In freezing temperatures, it may be necessary to recirculate the water through the system to avoid freezing. To accomplish this:

2. Remove the dig lance handgun and connect the hose to the QD fitting located next to the by-pass valve. Make sure the by-pass valve is closed.

3. Operate the hydraulic pump PTO as described in the "Water Lance Operation" section.

4. Then turn on the winter recirculation switch on the control panel. Water will circulate through the entire system both when you are traveling and when stationary.

5. If your unit is equipped with an optional water heater, you may turn the heater on to warm up the circulating water. The water temperature of the circulating water should never exceed 130° Fahrenheit (54° Celsius).
Air Purge

It is often beneficial to purge the water from all water lines to prepare for freezing temperatures and before using the anti-freeze injection system. The Mud Dog is equipped with an integral air purge line and ball valve located under the main control panel. To purge the water from the water system:

1. Drain all water from the water tanks.
2. Open the drain petcock at the return line water pump inlet.
3. Remove the inlet strainer cup.
4. Open the by-pass valve.
5. Connect the handgun to the water hose. (Remove dig lances from the handgun.)
6. Open the air purge ball valve.
7. Point the handgun in a safe direction and pull the trigger until no more water comes out. This will take about 2 minutes (less than 1 minute without the heater).
8. Close the air purge ball valve and wait 2 minutes to let the chassis air supply recover. Then repeat the previous step.
9. Open the drain valve at the water pump outlet.
10. Open the manifold drain petcock valve below the by-pass valve and temporarily push open the quick disconnect and fully drain.
11. Turn the water pump on for 1 second only. This helps purge water out of the pump manifold.
12. Close the air purge ball valve.
13. Close all drain petcocks after all water is purged.

NOTES

Never depend only on blowing the water out of your system (if you have an optional water heater) as not all the water will drain from the heater and could freeze causing heater coil damage.
Anti Freeze System

The antifreeze system is used to prevent freeze-ups of the water pump, water heater and water piping located inside the cabinet. RV antifreeze (propylene glycol) should be used instead of automotive antifreeze since it is environmentally friendly and less expensive. The antifreeze originally supplied with your Mud Dog is a high performance RV that stays liquid down to -50°F (-46°C) and has burst protection down to -100°F (-73°C). Regular RV antifreeze will start to turn slushy at -10°F (-23°C) and has burst protection down to -50°F (-46°C). Follow the procedure as listed:

1. Open the water tank/drain valve. This valve is located at the rear of truck or between the cabinet and the debris body on the driver's side. Completely drain the water tanks.
2. Confirm the antifreeze supply line valve is closed.
3. Remove the inlet strainer cup and screen.
4. Open the water inlet valve. Drain completely.
5. Close the water supply valve.
6. Replace the inlet strainer screen and cup.
7. Open the antifreeze supply valve.
8. Close the water tank return valve.
9. Close the manifold drain valve & bypass valve
10. Disconnect the lance from the handgun.
11. Connect the handgun to the high pressure water hose from the reel.
12. Confirm winter recirculation switch is off and flow control dial is at zero.
13. Start the engine and engage the hydraulic pump as described elsewhere in the operating instructions.
14. Direct the handgun away from personnel, pull and hold the trigger.
15. Engage the water pump by turning on the winter recirculation switch.

16. Observe the water discharging from the handgun. When the discharge turns the color of the antifreeze being used, release the handgun trigger.
17. After releasing the handgun trigger, open the high pressure water bypass valve a few seconds to send antifreeze through the return to tank line.
18. Disengage the water pump by turning off winter recirculation switch.
19. Disengage the hydraulic pump and shut off the engine as described elsewhere in the manual.

Air purge Anti-freeze back into Anti-freeze tank

1. Point handgun in Anti-freeze tank, pull and hold trigger.
2. Open Bypass and air purge valve.
3. When Anti-freeze is purged back into Antifreeze tank close Bypass valve and air purge valve.

NOTES

Periodically the strength of the antifreeze should be checked and replaced as required to prevent freeze-up based on your low temperature as it does get diluted each time it is used.

The water system is now protected from freezing during periods of nonuse in cold weather.
Lance/Cleaning Gun Precautions

The cleaning gun should be operated only by trained operators. Please read the following instructions before attempting to operate.

<table>
<thead>
<tr>
<th>DO NOT:</th>
<th>DO:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heed these warnings - or serious injury and permanent injury may result</td>
<td>Safety should always be observed</td>
</tr>
<tr>
<td>Aim gun at any person or any parts of the body. Fluids under high pressure can penetrate the human skin and can cause severe injury, possibly resulting in amputation or death. If any part of the body comes in contact with the spray stream, immediately contact a physician.</td>
<td>Develop a habit of shutting off the pressure to the gun and hose before attempting to remove the nozzle, gun or any part of the gun, or when fun is not in use.</td>
</tr>
<tr>
<td>Place hand or any other portion of the body in front of the spray nozzle.</td>
<td>Carefully check and tighten threaded connections regularly. Make them secure and leak proof.</td>
</tr>
<tr>
<td>Alter equipment in any manner. If repairs are necessary, use only genuine factory repair parts available from Super Products.</td>
<td>Make sure the trigger is properly operating.</td>
</tr>
<tr>
<td>Operate gun w/o trigger guard attached.</td>
<td>Adopt a secure body stance prior to and during operation onto control the reactionary force of the gun.</td>
</tr>
<tr>
<td>Exceed the maximum operating pressure of 3000 psi.</td>
<td>Keep gun clean to allow for positive grip and safe operation.</td>
</tr>
<tr>
<td>Leave equipment under pressure unattended at any time. Relieve pressure by shutting off the water system; then actuate the gun trigger until all water ceases to flow.</td>
<td>Impress on other people in the area the importance of obeying strict safety precautions for everyone’s safety.</td>
</tr>
<tr>
<td>Use damaged or weakened hose.</td>
<td>Make sure gun is insulated properly when used in a dangerous environment.</td>
</tr>
<tr>
<td>Operate the gun if there are any leaks from the packing, fittings, hoses, etc.</td>
<td>Never exceed maximum operating pressure. Make sure relief valve is properly operating.</td>
</tr>
<tr>
<td>Tap or otherwise lock trigger into the ON position.</td>
<td></td>
</tr>
</tbody>
</table>
Dumping Payload

4. Position truck at dump site, engage parking brake and position wheel chocks.

5. Engage water and hydraulic systems as described elsewhere in this manual.

6. From main control panel set "Dig-Dump" mode switch to "DUMP".

7. Ensure that the tailgate area is clear of people and obstructions.

8. Press the YELLOW SHIFT button AND the TG OPEN button on the remote at the same time. This button controls a two step function. First the tailgate latches unlock. Then the tailgate rises. Then the ejector plate extends. Release this button at any time to pause the process. A Dump/Retract switch is also provided on the rear right hand corner of the cabinet.

9. Press the YELLOW SHIFT button and the EJECT out button on the remote at the same time. This will extend the Ejector plate out and push material out of the body. Release this button at any time to pause the process. An Eject switch is also provided on the rear right hand corner of the cabinet.

10. Connect water hose to body flusher connection. Turn water pump on. Water will come out of spray bar inside body.

11. Connect the water hose to the handgun and clean tailgate sealing surfaces, tailgate, pusher plate and back of unit as required.

12. Reverse above procedures when completed. Two green lights on the rear right hand corner of the cabinet will come on when the ejector plate is in the forward position and the tailgate latches are locked.

Some Mud Dogs include a body Tilt feature to assist in emptying the debris body. To raise the body, press the YELLEO SHIFT button AND the BODY TILT button on the remote at the same time. Note, the boom should be positioned in its cradle when raising the body. There is also a body tilt switch located on the panel on the rear right side of the main cabin.
When lowering the body, press and hold the lower button for two full seconds after the body contracts the chassis frame rails. This applies the proper retraction force to properly secure the body.

Separator Air System

Your unit is equipped with a separator. There is little for the operator to do except periodically check for any material accumulation in the bottom of the unit and manually clean out. This separator is located in the air stream between the top of the body and the vacuum pump.

Front Body Drain Valve

Your unit has the front body drain valve so you can drain excess liquids from the body through such. Because the pusher plate keeps the larger materials away from this drain, you can drain off virtually all the liquid resulting in a relatively dry payload for the disposal site. Make sure the drain hose is properly secured before moving the unit. If the drain valve should plug, you can suck air backwards through it by blocking off the inlet hose, and engaging the vacuum pump. Allow the vacuum to build up some and then open the drain valve. The drain hose must be disconnected when you do this. Make sure all body parts and clothing are away from the valve opening before opening the valve.

Debris Level Sensor (Optional)

Your unit may be equipped with a Debris Level Sensor which will inform the operator of the debris level in the collector body. The system senses liquids, slurries, and solids and operates in the full vacuum environment in the collector body (up to 28" Hg). The components are immune to air flow, noise, vibration, dust, humidity and temperature.

The Debris Level system measures the debris level and includes four red lights representing 25%, 50%, 75%, and 100% full. The lights are located on the main storage cabin above the passenger side door. Additionally the top light (fourth light) will blink when the debris body is about 90% full. This should serve as a warning to the operator that the debris body is almost full. When the body is 100% full the top light will stay lit and the vacuum relief door will open and prevent overfilling.

Ensure the area is clear of hazards before raising or lowering the body.
Chapter 4
Lubrication and Maintenance

General Information
People who maintain this unit should have a basic understanding of the equipment and normal sequence of operation. Refer to other sections of this manual.

When any repairs or adjustments are made to this unit, extreme care should be taken and all safety precautions and decals observed.

Preventive maintenance routines keep the equipment in proper working condition. Preventive maintenance is not only desirable, but is necessary, since scheduled inspection insures continued trouble free operation of the equipment. It also prevents, or at least detects, at an early stage mechanical, hydraulic, or electrical troubles that might otherwise develop into equipment malfunction.

Preventive Maintenance Instructions
We urge you to protect your investment by servicing it according to the maintenance schedule listed on the following pages. Regular maintenance will insure maximum unit performance, long unit life, safety, reliability, and full warranty protection.

Each maintenance item is numbered and is described on the pages following the schedule.

## LUBRICATION AND MAINTENANCE

### POWER UNIT
- **Vacuum Pump Oil Level (5 qt)**: Inspect, Replace
- **Water Pump Oil Level (2.11qt)**: Inspect, Replace
- **Final Filter Cartridge**: Clean, Inspect, Replace
- **Drain Valves**: Inspect, Clean
- **Nuts and Bolts**: Inspect/Tighten
- **Transfer Case (11 qt)**: Inspect, Replace
- **Driveshafts**: Inspect/Lubricate

### WATER SYSTEM
- **Suction Strainer**: Clean, Inspect
- **Water Tanks**: Clean
- **Water Tank Connections**: Inspect
- **Ball Valves**: Inspect/Adjust
- **Pressure Gauge**: Inspect
- **Handgun Connections**: Clean/Inspect
- **Drain System**: Clean
- **Regulator**: Inspect
- **Hose**: Inspect
- **Nozzles**: Inspect
- **Water Pump**: See Pump Section

### WATER RECIRCULATION
- **Check Valve**: Inspect

### AIR PURGE
- **Ball Valve**: Inspect
- **Check Valve**: Inspect

### CABINET AND TOOL BOX DOORS
- **Hinges**: Lubricate
- **Latches**: Lubricate/Adjust
- **Foam Gasket**: Inspect

### PTO GREASE
- **PTO GREASE**: Lubricate
**LUBRICATION AND MAINTENANCE**

**Maintenance Items**

Note: Any greasing of unit should be done with a general purpose lithium base grease unless otherwise noted.

**Boom**

1. The boom bearing and boom pivot hinges are greased from ground level. The grease distribution device’s on the passenger side of the truck. Apply grease to the zerk fitting of the grease distribution device weekly.
2. Inspect boom bearing teeth for wear or cracking.
3. The boom extension joint is a lifetime polymer slide. No lubrication is necessary.
4. The telescopic boom tube includes a rubber seal between the inner round boom tube and the outer round boom tube. The lubrication fittings for this seal are on a manifold near the tailgate on the passenger side. Grease this seal weekly.

**Debris Body**

1. Body Interior: Empty material from debris body daily and clean interior with use of spray bar flushing system (if equipped) or handgun. Clean tailgate sealing surface.
2. Tailgate Seal: Clean tailgate seal after each discharge of debris with the use of the handgun. Inspect seal weekly for rips, tears, and proper alignment with the body. Replace as required.
3. Hydraulic Tailgate Latch Rollers: Clean tailgate latch rollers after each discharge of debris. Lubricate rollers by hand with grease weekly. Inspect condition of rollers and replace if signs of wear appear.
4. Hydraulic Tailgate Latches: Clean any debris off latches daily. Lubricate latch pivots with grease. The upper tailgate latches are lubricated via the grease distribution device on the tailgate at about eye level. The lower tailgate latches are lubricated individually and should be greased more often than the upper latches. Inspect latch rods for bending or bearings for wear.
6. Seal Around Telescopic Cylinder: Inspect rubber seal around pusher plate telescopic cylinder to make sure it is tight and not damaged.
7. Float Ball: Clean float ball daily or after each load. Inspect ball weekly for dents and proper sealing.
8. Tailgate Hinge: The upper tailgate hinge is lubricated via the grease distribution device on the tailgate at about eye level.
9. Body Drain Valve and Hose: Inspect hose for leaks and wear, and the valve for proper sealing weekly. This applies to both rear and front drain. (If Equipped)
10. Debris Level Indicator: Check that sensor is cleaned daily.

**Electrical System**

1. Fuses: Inspect auxiliary fuse panel located in control panel for blown fuses. Replace only with a fuse of same rating.
2. Lights: Inspect that all vehicle lights are in good condition and working properly.
3. Boom Pendant Plug and Receptacle: Inspect pendant plug and receptacle for contact and proper alignment. Clean terminals monthly and lubricate with dielectric grease if problems arise.

**Hydraulic System**

1. Hydraulic Oil: Inspect hydraulic oil level in reservoir weekly. Oil level should be at the center of the sight glass with all cylinders retracted. Add oil if necessary. Change oil after first month of operation. Then change oil every 12 months or 1000 hours whichever comes first. Refer to 'Recommended Lubricants' in this manual.
2. Hydraulic Filter: Initially replace hydraulic filter after first month of operation then replace every six (6) months or sooner if filter indicator light on the control panel comes on.
3. Hoses and Fittings: Inspect all hoses and fittings for leaks. Check hoses for cracks, fraying and rubbing. Replace damaged hoses and tighten fittings.

**Power Unit:**

1. Vacuum Pump Oil Level: Inspect oil level of vacuum pump daily. Level should be half way up the sight tube on the shaft end of the pump and half way in the sight eye in the tail end. Add oil if necessary. Initially change oil in vacuum pump after 100 hours of use and then every twelve (12) months or 1,000 hours whichever occurs first. Refer to 'Recommended Lubricants' in this manual.
2. Water Pump Oil Level: Inspect oil level of water pump daily. Level on horizontally mounted pumps should be checked at the sight gauge. On vertically mounted pumps the oil level can be checked by removing a fill plug on the top right hand side of the gear case. Add oil if necessary. Initially change oil in water pump after 100 hours of operation and then every twelve (12) months or 1,000 hours whichever comes first. Refer to 'Recommended Lubricants' in this manual.

4. Bolts and Nuts: Check that all bolts and nuts are tightened securely.

5. Transfer Case: Inspect oil level of transfer case weekly. Level should be at the center of the sightglass. Add oil if necessary. Initially change oil in splitshaft after 100 hours of use and then every 12 months or 1,000 hours whichever comes first. Refer to 'Recommended Lubricants' in this manual.

6. Driveshafts: Lubricate the driveshafts and inspect universal joints for wear monthly.

Water System

1. Suction Strainer: Remove water pump suction strainer daily and clean. Inspect strainer weekly for leaks or damage and replace as necessary.

2. Water Tanks: Inspect the interior of water tanks monthly for sand, rust, etc. through top inspection ports. Clean as necessary.

3. Water Tank Connections: Inspect water tank connections for leaks, damage, or wear monthly. Adjust or replace as required.

4. Ball Valves: Inspect ball valves for proper operation and wear. Adjust stem packing if leaks occur. Rebuild or replace valves if necessary.

5. Pressure Gauge: Inspect water pressure gauge and for proper operation or damage. Make sure gauge resets to zero. In freezing weather, store gauge in warm area.

6. Handgun Connections: Inspect and clean handgun connections for proper operation or leaks daily.

7. Drain System: In freezing weather, drain entire water system and hose. See detailed drain system instructions located in this manual.

8. Regulator: Inspect regulator for leaks and any possible spring damage.

9. Hose: Inspect hose for tears or damage.

10. Nozzles: Inspect nozzles for worn or plugged orifices and cracked housing. Repair/replace as necessary. Check that nozzle pressure rating matches unit.

Air Purge

1. Ball Valve: Inspect ball valve for proper operation and wear. Adjust stem packing if leaks occur. Rebuild or replace valve if necessary.

2. Check Valve: Check for water in air tanks. If present, check that valve is operating properly not allowing water into air tanks.

Cabinet & Toolbox Doors

1. Hinges: Lubricate panel hinges with oil monthly.

2. Latches: Lubricate panel latches monthly with oil. Adjust latches to insure proper panel retention.

3. Foam Gasket: Inspect foam seal around panel monthly. Replace if damaged or missing.

Adjusting Hydraulic Tailgate Latches & Hinges

Adjusting the Tailgate Hinges (See Fig. 1):
If the tailgate becomes offset such that the latches won't line up, then check tailgate hinge and hinge supports at the top of the debris body. Call Super Products at 1-800-837-9711 for assistance in diagnosing and correcting. The following procedure may be prescribed, but should only be undertaken by a qualified mechanic.

1. If offset, open the tailgate about 8 inches and attach a come-along to the cylinder bracket. Pull the tailgate about 4 inches past center.

2. Release come-along and re-check alignment. Repeat if necessary, decreasing overstroke each time.

3. When tailgate is aligned properly on center, engage latches.

4. Loosen bolts holding hinge plates.

5. Securely clamp top of tailgate to body flange.

6. Adjust actuator cylinder clevis, if necessary, for proper gap on bottom latchplate.

7. Adjust gap of remaining latchplates using the adjustment rods.

8. When adjusting lower rods, start by leaving extra gap between upper plate and roller. Adjust lower latchplate, then upper, on each side.
9. Retighten hinge plate bolts. Make sure the bottom edge of hinge support plate is in full contact with support. Weld the front vertical edge of each hinge plate to the mounting plate with a 3/16" fillet.

Adjusting the Tailgate Latches (See Figure 2)

1. Close tailgate completely and lock the latches with the hydraulic control.
2. All latches should be in the same contact position with the cam roller. The latch should contact the cam roller to maintain a 1/8" gap between the roller and the machine edge of the latch pin. See Figure 2.
3. If there is a latch which is not in the same contact position, an adjustment will be required.
4. Adjust by removing the hairpin retainer and pin from the central cam end of rod.
5. Release latches and loosen clevis locknuts on each end and rotate each clevis equally as both are right hand threaded. Replace pin and hairpin and check engagement.
6. Adjust so that the flat on each locking cam is completely under the body bracket roller. Exact sequence can vary but keep all engagements equal throughout this process.
7. When correct engagement is achieved, tighten clevis locknuts securely and make sure that hairpin retainers are in place.
8. If the tailgate gasket is leaking, the latch in the area of the leak must be individually tightened. They are shim-adjusted, with standard 5/8" flat washers. After fully opening latches, remove the wedge roller bolts and add a flat washer. Retighten roller bolts securely and recheck wedge adjustment, as above. Recheck leakage and repeat roller adjustment as necessary.

Ejector Plate Slide Pad and Wiper Adjustment

The ejector plate slide pads should be adjusted or replaced whenever the end of the angle iron guard over the pusher cylinder can be moved up and down 1/2" by hand while the plate is at the narrowest point of its travel.

**CAUTION**
Failure to maintain proper slide pad adjustment can result in premature ejector plate failure not covered by warranty.

1. Open tailgate and support it on its props. Clean the debris body, ejector plate and slide pad assemblies with pressurized water. Fully retract ejector plate.

**WARNING**
Failure to securely support tailgate whenever working beneath it may cause injury or death.

**WARNING**
Shut truck engine off and pocket the keys EACH TIME that the body must be reentered or when working under the raised tailgate. Failure to do this could result in injury or death.

2. Enter body through tailgate and measure distance between guide rails every 18" to determine narrowest point. Exit from body and move the plate to this point.
3. Remove pad cover and check pad thickness to determine if replacement is necessary. A pad should be replaced when there is less than ¼" of pad behind the pad covers (See FIG. 1.) If so, loosen adjusting bolt lock nut and loosen 1-1/8 hex adjusting bolt, upper and lower pads. FIG. 2.
4. Thread self-taping screw with slide hammer (Super Products P/N 3000-03254) into lower pad and tap out. See FIG. 3. Use pry bar to lift Ejector plate. Follow same steps to remove upper pad.

5. Insert backup bars and slide pads, beveled edge toward guide rail. Follow same steps for other side.

7. Tighten upper pad adjusting screws so there is ¼" of white pad showing on each side.

8. Position the ejector plate side-to-side with a pry bar so there is an equal gap on both sides of the body. See Fig. 2.

9. Tighten bottom pads to 40 ft-lbs. each side

10. Move the plate backward 2 feet & then back to narrowest point.

11. Tighten to 75 ft-lbs. each side.

12. Move the plate backward 2 feet & then back to narrowest point.

13. Loosen bottom pads 2 turns each, & tighten lock nuts.

14. Restart engine and check for binding of the plate throughout its full stroke. If it binds, evenly back off lower adjusting screws ½ turn each.

**Wiper Adjustment**

Extend ejector plate to rear edge of body. Note clearances between wiper and around perimeter inside of body. Using a block of wood and a hammer, knock wiper segments outward until they just contact the inside wall of the body.
Troubleshooting Overview

This guide is intended as a quick reference to aid operators and technicians in troubleshooting potential issues with the Super Products’ Mud Dog® Vacuum Excavator.

This guide describes symptoms and lists several probable causes and their solutions. The primary rule of troubleshooting is to check the simple things first; therefore, the probable causes are generally listed in order of simplest to most complex.

Before attempting any repair, read, understand, and follow the operator's manual instructions, warnings, and safety messages.

All repairs should be performed by a qualified technician.

Before attempting any Troubleshooting you must call our Customer Service Representatives at 262-784-7100

The Basic Troubleshooting Process

1. Prepare tools, information, and safety equipment.
2. Define the symptom.
   - What is the problem?
   - When does it occur?
   - When did it work properly?
   - When did it stop working properly?
   - What was done in between those times?
3. Reproduce the symptom.
4. Narrow it down to the root cause.
   - Proceed logically.
   - Check the simple things first.
   - Divide and conquer — rule out what is not the problem. This is especially important to define if the root cause is human error, electrical, hydraulic, or mechanical.
   - Believe your evidence — if all else is eliminated, that which remains must be true.
   - Never assume anything — check it yourself.
5. Repair or replace the defective component.
6. Educate and train the operator when it is a case of human error.
7. Verify the symptom is gone.

• Check everything — you could have multiple faults.

Remote Throttle Troubleshooting

Summary:
This document details the steps needed to troubleshoot the Mud Dog Remote Throttle Control operation. This document describes the mechanical and electrical processes that occur when putting the truck into work mode. Perform these steps to determine where there is a problem.

1. Assure that all dash switches are off, especially Cruise Control and Remote Control (a.k.a. Throttle Enable). Start the truck with the transmission in Neutral or Park. Assure there are no chassis error messages or that the truck needs to perform a REGEN operation.

Note: Either the Remote Control (a.k.a. Throttle Enable) switch OR the Rear Axle Disengage lever will enable the Throttle Enable function, thereby giving engine throttle control to the Mud Dog control system. The following steps are for when each function is done separately. Typically, both are enabled at the same time. Therefore, the remote control switch is always turned on last.

2. To enable the hydraulic system, push in the clutch pedal, wait for 3 to 5 seconds, and then engage the Hydraulic PTO by enabling the PTO air shift switch or lever. The PTO air pressure switch will close confirming that the PTO is enabled. The PTO HYD EN LED will light on the chassis module and the hydraulic cooling fan will run. Release the clutch pedal.

3. Keeping your foot off the clutch pedal, turn on the dash Remote Control switch. The engine will go into PTO mode and the engine RPM will increase slightly as confirmation that the engine is in PTO mode. Engine PTO can be disabled by pressing the clutch pedal.

4. To enable the blower and disengage the rear axle, push in the clutch pedal, wait for 3 to 5 seconds, and then lift the Blower/Rear Axle Disengage lever upward until the Rear Axle Disengage dash light is illuminated. The vent door will open and the Vent Door Open LED will light on the chassis module. The Rear Axle Diseng LT and the Throttle Enable LEDs will light on the Control Module.

5. Put the transmission into the desired gear and slowly let out the clutch. The SS EN PROX SW and the Throttle EN LED will light on the chassis module. The dash may display a parking brake error message and the speedometer may show road speed until engine PTO mode is established. PTO mode will not enable until a vacuum RPM increase or decrease is given. Once in PTO mode, any error message will clear and the speedometer will drop to zero.

Note: The Vent Door Open EN LED or the Vent Door Open LEDs will not be lit initially until the Vent Door switch on the control panel or remote control is cycled.

6. If the PTO mode will not enable, determine if the Throttle Enable LED is lit on the control module. The Throttle Increase and Decrease LEDs may also be lit or flashing.

7. Locate the throttle control relay, typically found behind the fuse panel door. On it, there are four LEDs. The LEDs are labeled 1 thru 4. They are for:
   
   #1 = Throttle Enable
   #2 = Throttle Increase
   #3 = Throttle Decrease Throttle Enable LE
   #4 = Fan Lock-up (no longer used)

   Assure that Throttle Enable LED is lit.

8. If the Throttle Enable LED is lit, use the vacuum function to assure that the increase and decrease LEDs light when given a command to increase or decrease vacuum blower RPM.

9. If the above functions do not operate properly, the PTO mode can be enabled manually to test that the engine PTO mode is working so as to eliminate a problem with the engine or chassis portion of the truck.

   a. Return the truck back to road mode by disabling the Remote Control switch, Hyd PTO, and the Vacuum Blower/Rear Axle disengage systems.
   b. With the truck idling and your foot off the clutch pedal, turn the cruise control switch on.
   c. On the set/resume switch, press the resume (lower) portion of the rocker switch for at least two seconds. The engine RPM will increase slightly to indicate that the engine is in PTO mode. The accelerator pedal should not be able to change engine speed.
   d. Press and hold the set switch. The engine RPM will increase, up to its maximum limit of 2000 RPM.
   e. Press and hold the resume switch. The engine RPM will decrease, down to its minimum idle speed of 700 RPM.
   f. Increase the RPM again up to 1000 RPM. Turn the Cruise Control switch off. The engine RPM should drop down to idle.
   g. Turn the cruise control switch on again. Increase the RPM to 1000 RPM, then depress the clutch peddle. The engine RPM should drop down to idle.
Eject / Retract Function Troubleshooting

Summary:
This document details the steps needed to troubleshoot the Mud Dog Eject/Retract function. This document describes the mechanical and electrical processes that occur when ejecting material from a Mud Dog debris body. Perform these steps to determine where there is a problem.

1. The truck must be in work mode.
2. Switch the control system to dig mode
3. Press and hold the shift and the eject buttons on the remote control, wired or wireless to start the ejection sequence.
4. The tailgate locks begin to unlatch. The tailgate prox switch LED goes out, the green Tailgate Latched cabinet LED goes out, and the reverse lights and back-up beeper is on.
5. The tailgate hinge prox switch LED is off. After a two second delay, the tailgate starts to open. When the tailgate is almost horizontal, the tailgate hinge prox switch LED turns on.
6. After a two second delay, the pusher plate will eject the load until the plate is past the end of the body. The engine RPM will increase.
7. The tailgate props are extended for safety.

Note: At this point, the operator may take time to clean the debris body. In some cases, the tailgate may have very slowly crept downward from horizontal to the point where the tailgate hinge prox switch LED is off again.
8. If the tailgate is not open all the way, press the shift and eject buttons again to raise the tailgate again.
9. To start the retract sequence, press and hold the shift and retract buttons on the remote control. The pusher plate will start to retract and the engine RPM will increase.
10. When the pusher plate is fully retracted, the retract prox switch LED should be on. The Plate Retracted green LED on the cabinet should go on.
11. After a two second delay, the tailgate will start to lower and the reverse lights and back-up beeper is on.
12. When the tailgate is fully closed, the tailgate closed prox LED will go on.
13. After a two second delay, the tailgate latch will start to lock the tailgate. When fully latched, the tailgate latched prox switch LED will go on. The Tailgate Latched cabinet LED goes on.
14. Release the remote control buttons at any time and all functions, back-up lights, and back-up beeper turns off.

Winter Recirculation Troubleshooting

Winter circulation function:
1. Start the truck. The truck can be in road or work mode for Winter Recirculation.
2. The hydraulic system PTO must be enabled. The PTO Confirm Hyd LED is lit on the chassis module.
3. There must be water in the tanks.
4. Without putting the hose through the external pass-through at the cabinet ladder, connect the lance hose to the water return line quick connect.
5. Turn the high pressure water bypass valve closed.
6. Turn the Water Heater switch on at the control panel. The Water Heater SW LED is lit.
7. Turn the Winter Recirculation switch on at the control panel. The Winter Recirculation SW LED is lit.
8. The Water Heater EN signal enables the water heater relay (RY3) which sends power to water heater.

When the Water Heater EN signal passes through the thermostat switch and the water flow switch(es), the water heater should fire. Keep the cabinet door closed.
